Lecture – 40
Properties of Z – transforms – I

Hello friends, welcome to my lecture on properties of Z transforms. The topic of properties of Z transforms will be covered in 2 lectures. This is first lecture on the properties of Z transforms. In the last lecture, we had obtained the values of z operating and u n equal to n and z operating on u n equal to n square. So, now, we will talk about z operating on cos n theta.

(Refer Slide Time: 00:53)

So, let suppose we have to find Z of cos n theta we know that cos n theta can be written as e to the power i n theta plus e to the power minus i n theta by 2. Now by applying the linearity property of z, we can write it as 1 by 2 z of e raise to the power of i n theta plus z of e to the power minus i n theta. Now let us recall the result; we can write, now let us find let us find z of e raise to the power i n theta e to the power i n theta we may write as z of e to the power i theta raise to the power n. Here we shall apply the formula for Z transform of a to the power n z we know that Z transform of a to the power n is z over z

minus a provided mod of z is greater than mod of a. So, let us take a equal to e to the power i theta here.

So, then we shall have z over z minus e to the power i theta where mod of z is greater than mod of e i theta and the mod of e i theta is what e i theta is cos theta plus i sin theta. So, mod of e i theta is square root cos square theta plus sin square theta and you know that and it is equal to 1. So, this is z over z minus e i theta provided mod of z is greater than 1. Similarly Z transform of e to the power minus i n theta we can write as Z transform of e to the power minus i theta raise to the power n.

Now here we shall take a equal to e to the power minus i theta and then again apply he formula Z transform of a to the power n equal to z over z minus a now where mod of z is greater than mod of e to the power minus i theta mod of e to the power minus i theta is also equal to 1. So, this is equal to z over z minus e raise to the power minus i theta where mod of z is greater than mod of e raise to the power minus i theta which is also equal to 1 and the let us now put the values of Z transforms of e to the power i n theta e to the power minus i n theta. So, then we shall have.

(Refer Slide Time: 04:10)

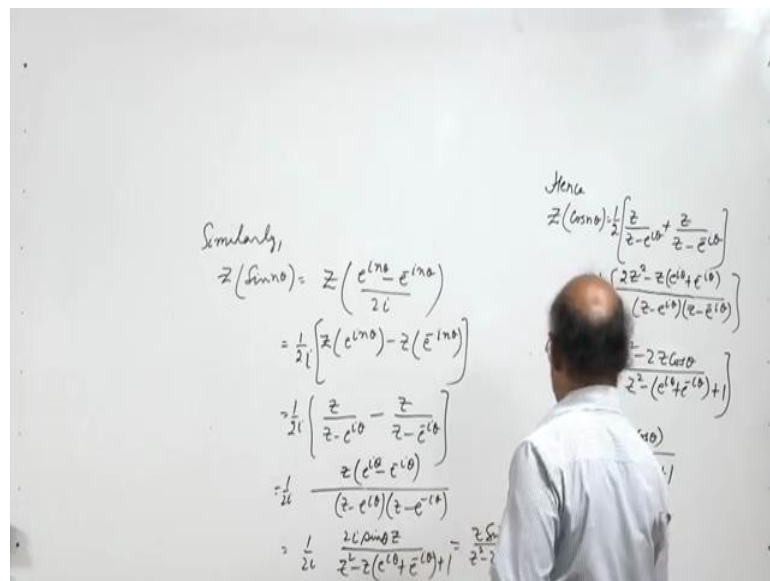

So, hence Z transform of cos n theta will be equal to 1 by 2 z over z minus e i theta plus z

over z minus e to the power i theta and we can write this equal to; this is z minus $e^{i\theta}$ into z minus e raise to the power minus i theta so then z square.

So, and then, it is $2z$ square minus z times e to the power i theta plus e to the power minus i theta. So, we can write it as 1 by 2 ; $2z$ square minus $2z \cos \theta$ divided by z square minus e to the power i theta plus e to the power minus i theta and then plus e to the power i theta into e to the power minus i theta is it power 0 . So, we have 1 . So, this is equal to z into z by minus $\cos \theta$ divided by z square minus $2z \cos \theta$ plus 1 . So, Z transform of $\cos n \theta$ is z into z minus $\cos \theta$ divided by z square minus $2z \cos \theta$ plus 1 . You know similarly we can find Z transform of $\sin n \theta$.

(Refer Slide Time: 06:14)

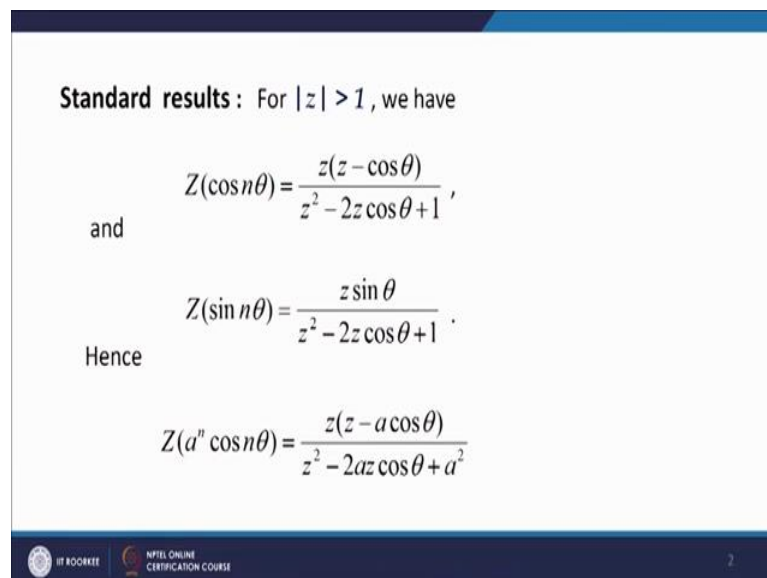

So, when we write Z transform of $\sin n \theta$ we shall have similarly Z transform of $\sin n \theta$ this will be equal to 1 by $2i$, let me write it like this, first we can write it as Z transform of e to the power $i n \theta$ minus e to the power minus $i n \theta$ divided by $2i$ and by using linearity property, this is 1 over $2i$ Z transform of e to the power $i n \theta$ minus Z transform of e to the power minus $i n \theta$ which is 1 by $2i$ Z transform of e to the power $i n \theta$ is z over z minus $e^{i\theta}$ and this is z over z minus e to the power minus i theta this is equal to 1 by $2i$ z minus $e^{i\theta}$ into z minus e raise to the power minus i theta and then z square times z square minus z e to the power minus i theta minus

z^2 will cancel and will get minus z times e raised to the power.

Let me write it like this. So, this is equal to z minus $z e$ to the power minus $i\theta$ and here we will have plus $z e$ to the power $i\theta$. So, z times e to the power $i\theta$ minus e to the power minus $i\theta$ and e to the power $i\theta$ minus e to the power minus $i\theta$ is $2i \sin \theta$. So, we shall have 1 by $2i \sin \theta$ into z divided by z^2 minus z times e to the power $i\theta$ plus e to the power minus $i\theta$ plus 1 . So, this is $2i \sin \theta$ divided by z^2 minus $2z \cos \theta$ plus 1 where $\text{mod of } z$ is greater than 1 .

(Refer Slide Time: 08:39)

Standard results : For $|z| > 1$, we have

$$Z(\cos n\theta) = \frac{z(z - \cos \theta)}{z^2 - 2z \cos \theta + 1},$$

and

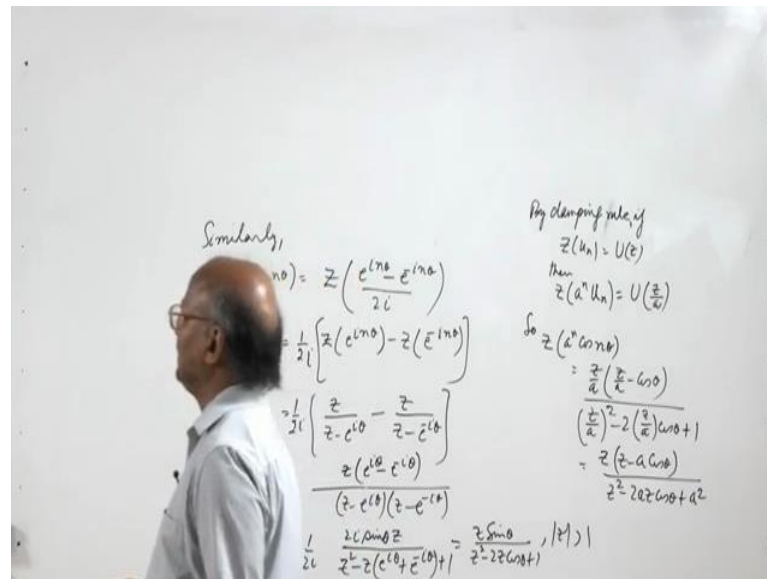

$$Z(\sin n\theta) = \frac{z \sin \theta}{z^2 - 2z \cos \theta + 1}.$$

Hence

$$Z(a^n \cos n\theta) = \frac{z(z - a \cos \theta)}{z^2 - 2az \cos \theta + a^2}$$

IT ROCKET NPTEL ONLINE CERTIFICATION COURSE 2

(Refer Slide Time: 08:50)

So, that is how we find the Z transform of $\sin n \theta$ and then Z transform of $a^n \cos n \theta$. We can obtain by damping rule, let us recall the damping rule, we know that by damping rule, if Z transform of sequence u_n is $U(z)$ then Z transform of $a^n u_n$ is equal to $U(z/a)$. So, Z transform of $a^n \cos n \theta$ will be equal to in the Z transform of $\cos n \theta$ in the Z transform of $\cos n \theta$ which is $z(z - \cos \theta) / (z^2 - 2z \cos \theta + 1)$. Let us replace z by z/a . So, we get and this will give you $(z/a) / (z/a - \cos \theta + 1)$ and this will give you $(z - a \cos \theta) / (z^2 - 2az \cos \theta + a^2)$. So, we get Z transform of $a^n \cos n \theta$ by using the damping rule.

(Refer Slide Time: 10:16)

and
$$Z(a^n \sin n\theta) = \frac{az \sin \theta}{z^2 - 2az \cos \theta + a^2}.$$

Shifting Properties

1. Shifting u_n to the right:

Theorem 1. If $Z(u_n) = U(z)$ then
$$Z(u_{n-k}) = z^{-k} U(z), k > 0.$$

IT 6008EE NPTEL ONLINE CERTIFICATION COURSE 3

And similarly by using the dumping rule we can obtain the Z transform of $a^n \sin n\theta$ in the Z transform of $\sin n\theta$ which is $z \sin \theta$ over $z^2 - 2z \cos \theta + 1$. We replace z by az to arrive at $az \sin \theta$ over $z^2 - 2az \cos \theta + a^2$. Now let us discuss the shifting properties like we have the shifting theorems in the Laplace transform here also we have the shifting theorems, now the first theorem is giving us a result when there is a shifting of the sequence u_n to the right, suppose Z transform of a sequence u_n is given by $U(z)$ then Z transform of u_{n-k} is equal to $z^{-k} U(z)$ where k is a positive integer.

(Refer Slide Time: 11:13)

Proof: By definition of the Z-transform

$$\begin{aligned} Z(u_{n-k}) &= \sum_{n=0}^{\infty} u_{n-k} z^{-n} \\ &= \sum_{n=0}^{\infty} u_{n-k} z^{-(n-k)} z^{-k} \\ &= z^{-k} \sum_{n=0}^{\infty} u_{n-k} z^{-(n-k)} \\ &= z^{-k} \sum_{j=-k}^{\infty} u_j z^{-j} \quad \text{putting } j = n - k \end{aligned}$$

IT ROOKEE NPTEL ONLINE CERTIFICATION COURSE 4

(Refer Slide Time: 11:17)

Let us see how we prove it, z we know that Z transform of u n Z transform of u n is sigma n is equal to 0 to infinity u n z to the power minus n. So, apply this definition to the sequence u n minus k. So, Z transform of u n minus k is equal to sigma n equal to 0 to infinity u n minus k z to the power minus n now z to the power minus n we can write as z to the power minus k into z to the power minus k this z to the power minus k is

independent of n . So, we can write it outside the summation, so z to the power minus k $\sum_{n=0}^{\infty} u_n z^{-n-k} = z^{-k} \sum_{n=0}^{\infty} u_n z^{-n}$. Now let us define the index j equal to $n - k$. So, when index j is $n - k$ since n begins with 0 n is equal to when n is equal to 0 j is equal to minus k .

So, we have this summation we of over j starting with minus k and when n is infinity j is equal to infinity. So, we have infinity here. So, we what we get is Z transform of u_n minus k is equal to and z to the power minus k $\sum_{j=-k}^{\infty} u_j z^{-j}$ to the power minus k now k is a positive integer. So, u_j wherever j is negative then we know that when we define the Z transform where we have assumed the sequence u_n to be equal to 0 when n is less than 0. So, we will be make use of that property of the sequence u_n .

(Refer Slide Time: 12:56)

$$= z^{-k} \sum_{j=0}^{\infty} u_j z^{-j} = z^{-k} U(z) \text{ because } u_j = 0 \text{ when } j < 0.$$

2. Shifting u_n to the left:

Theorem 2: If $Z(u_n) = U(z)$, then

$$Z(u_{n+k}) = z^k \left\{ U(z) - u_0 - \frac{u_1}{z} - \frac{u_2}{z^2} - \dots - \frac{u_{k-1}}{z^{k-1}} \right\}, \quad k > 0.$$

 IIT ROORKEE
  NPTL ONLINE CERTIFICATION COURSE

So, z to the power minus k and u_j you can see here u_j is 0 because whenever z j is 0 u_j is 0. So, j which was starting with minus k here, all these values of u_j where j is negative will be equal to 0 and so the summation will start with j equal to 0 and go to infinity. So, we have z to the power minus k $\sum_{j=0}^{\infty} u_j z^{-j-k}$ to the power minus k $\sum_{j=0}^{\infty} u_j z^{-j-k} = z^{-k} \sum_{j=0}^{\infty} u_j z^{-j}$. Now $\sum_{j=0}^{\infty} u_j z^{-j}$ is $U(z)$. So, what we get is $z^{-k} U(z)$.

So, when there is a shifting by k on derived side the; see the Z transform of the sequence u_{n-k} given by z^{-k} into Z transform of u_n . Now suppose there is shifting of u_n to the left. So, if Z transform of u_n is $U(z)$ then we shall see that Z transform of u_{n+k} the sequence u_{n+k} where k is again a positive integer is equal to z^k into $U(z)$ which is $z^k U(z)$.

So, this can also be said that here in the inside the bracket we have the Z transform of u_n sequence and from that we subtract the terms of the series $\sum_{n=0}^{k-1} u_n z^{-n}$. These are the terms of the series $\sum_{n=0}^{k-1} u_n z^{-n}$ where n runs over 0 and goes up to $k-1$. So, let us see the proof of this again recall the definition of Z transform of u_n Z transform of u_n is $\sum_{n=0}^{\infty} u_n z^{-n}$. So, Z transform of u_{n+k} Z transform of u_{n+k} will be $\sum_{n=0}^{\infty} u_{n+k} z^{-n}$ again we apply a use their use the same procedure here apply the same procedure z^{-n} can be written as $z^{-n+k} z^k$ and z^k can be taken outside the summation because it is independent of n . So, $z^k \sum_{n=0}^{\infty} u_{n+k} z^{-n}$ and plus k now let us define the index $j = n+k$.

So, here n was beginning with 0 and ending at infinity. So, n is equal to 0. So, j equal to k . So, summation over j will begin from k and go up to infinity because when n is infinity j is infinity. So, $z^k \sum_{j=k}^{\infty} u_j z^{-j}$ now. So, what we have is $z^k \sum_{j=k}^{\infty} u_j z^{-j}$ and then we have summation over j from k to infinity and we have $u_j z^{-j}$ what we will do is now we will we can do summation can be expressed as $\sum_{j=0}^{\infty} u_j z^{-j}$ and from that we subtract the terms $\sum_{j=0}^{k-1} u_j z^{-j}$.

(Refer Slide Time: 16:34)

$$= z^k \left[\sum_{j=0}^{\infty} u_j z^{-j} - \sum_{j=0}^{k-1} u_j z^{-j} \right]$$

$$= z^k \left[U(z) - u_0 - \frac{u_1}{z} - \frac{u_2}{z^2} - \dots - \frac{u_{k-1}}{z^{k-1}} \right].$$

In particular,

(i) $Z(u_{n+1}) = z (U(z) - u_0),$

(ii) $Z(u_{n+2}) = z^2 \left[U(z) - u_0 - \frac{u_1}{z} \right]$

 IIT ROORKEE
 NPTEL ONLINE CERTIFICATION COURSE
7

So, j equal to 0 to k minus 1 $u_j z$ to the power minus k. So, we subtract this sum and add this sum. So, when we add this sum to the existing sum that is $\sum_{j=0}^{\infty} u_j z^{-j}$ then we will have this $\sum_{j=0}^{\infty} u_j z^{-j}$ now this is nothing, but $U(z)$, Z transform of the sequence u_n . So, z to the power k z this is $U(z)$ and minus; you can write the terms of the sum. So, this is k j equal to 0 means you will not j equal to 1 means u_1 by z and j equal to 2 means u_2 by z square and so on minus u_{k-1} over z to the power minus 1.

So, this is shifting of this sequence going to the left, now in particular suppose we want to get the value of z of u_{n+1} . So, take k equal to 1 in this exp expression. So, z of u_{n+1} will be z times $U(z)$ minus u_0 and when you take k equal to 2 z of u_{n+2} will be equal to z square $U(z)$ minus u_0 minus u_1 by z .

(Refer Slide Time: 17:53)

(iii)
$$Z(u_{n+3}) = z^3 \left\{ U(z) - u_0 - \frac{u_1}{z} - \frac{u_2}{z^2} \right\}.$$

Example 1. let $u_n = \frac{1}{n!}$ then $Z(u_n) = e^{1/z}$.

Hence $Z\left(\frac{1}{(n+1)!}\right) = z(e^{1/z} - 1)$ and $Z\left(\frac{1}{(n+2)!}\right) = z^2(e^{1/z} - 1 - 1/z)$.

IT ROOCEE NPTEL ONLINE CERTIFICATION COURSE 8

And in a similar manner when we take k equal to 3 we get z of u n plus 3 equal to z q U z minus naught minus q 1 by z minus u 2 by z square.

(Refer Slide Time: 18:07)

$u_n = \frac{1}{n!}$
 $Z(u_n) = \sum_{n=0}^{\infty} u_n z^{-n}$
 $Z\left(\frac{1}{n!}\right) = \sum_{n=0}^{\infty} \frac{1}{n!} z^{-n} = e^{1/z}$
 $Z(u_{n+1}) = z[U(z) - u_0]$
 when $u_n = \frac{1}{n!}$ we get
 $Z\left(\frac{1}{(n+1)!}\right) = z\left[Z\left(\frac{1}{n!}\right) - 1\right] = z\left[e^{1/z} - 1\right]$

$Z(u_n) = \sum_{n=0}^{\infty} u_n z^{-n}$
 here
 $Z\left(\frac{1}{n!}\right) = e^{1/z} = 1 + \frac{1}{z} + \frac{1}{z^2 2!} + \dots$
 $\therefore u_0 = 1$

Let us take for an example the sequence u n to be equal to 1 by n factorial. So, let say when u n is 1 by factorial Z transform of u n is equal to sigma n equal to 0 to infinity u n

So, if u_n is $1/n!$, u_{n+2} is $1/(n+2)!$. So, this is z^2 times $U(z)$; z is Z transform of u_n . So, $1/n!$ minus u_{n+2} we have seen u_n is equal to $1 - u_{n+2}$; u_{n+2} is the coefficient of $1/z^2$ which is also 1 here. So, $1/z^2$ because Z transform of $n+2$ is z^2 times Z transform of u_n minus u_{n+2} minus $1/z^2$. So, this is z^2 times e to the power $1/z^2$ minus $1/z^2$.

(Refer Slide Time: 22:02)

Example 2. Let $u_n = 2n + 5 \sin \frac{n\pi}{4} - 3a^n$,

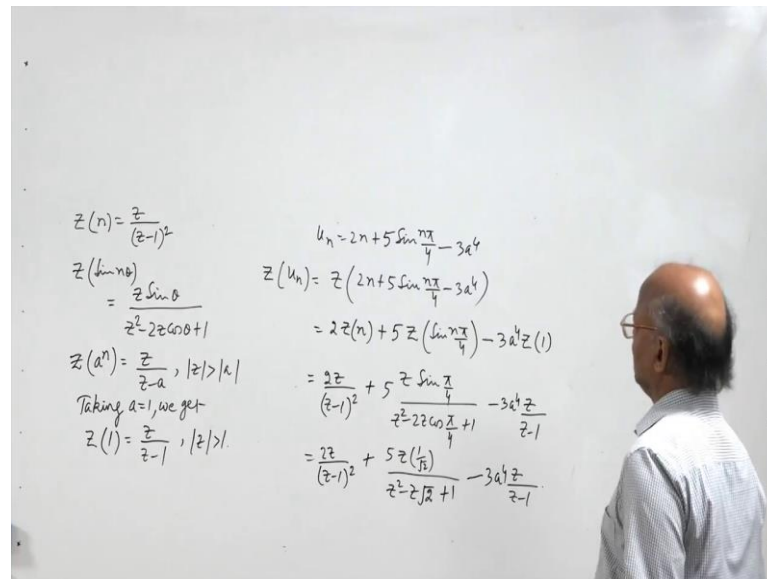

where a is some constant. Then

$$U(z) = \frac{2z}{(z-1)^2} + \frac{5(z/\sqrt{2})}{z^2 - z\sqrt{2} + 1} - 3a^n \frac{z}{z-1}.$$

IT ROORKEE | NPTEL ONLINE CERTIFICATION COURSE | 9

So, this is how we find the Z transform of $1/n!$. Now let us see an example where we shall find the Z transform of sequence u_n consisting of the terms $2n + 5 \sin n\pi/4$ and minus $3a^n$.

(Refer Slide Time: 22:21)

So, let us find the Z transform of u_n which is $2n + 5 \sin n \pi / 4$ and then minus $3a^4$ to the power 4. a is given to be a constant. So, Z transform of u_n is equal to Z transform of $2n + 5 \sin n \pi / 4 - 3a^4$. Now let us apply the linearity property. So, by the linearity property, this is 2 times Z transform of n plus 5 times Z transform of $\sin n \pi / 4$ and then minus $3a^4$ Z transform of 1. Now let us recall that Z transform of n is $z / (z - 1)^2$ we have earlier found the Z transform of n it came out to be $z / (z - 1)^2$ let us also recall the Z transform of $\sin n \theta$ it came out to be $z \sin \theta / (z^2 - 2z \cos \theta + 1)$ and then let us recall the Z transform of 1.

So, let us recall that Z transform of a^n is equal to $z / (z - a)$ provided $\text{mod } z > \text{mod } a$. So, here let us take $a = 1$. So, taking $a = 1$, we get 1^n that is 1. So, Z transform of 1 is equal to $z / (z - 1)$ provided $\text{mod } z > 1$. So, now, let us apply let us put these values here. So, 2 times $z / (z - 1)^2$ and then 5 times $z \sin \pi / 4$ here divided by $z^2 - 2z \cos \pi / 4 + 1$ and then minus $3a^4 z / (z - 1)$ now let us recall that $\sin \pi / 4$ and $\cos \pi / 4$ both are equal and equal to $1 / \sqrt{2}$. So, we will have $2z / (z - 1)^2$ and then we will have 5 times z into $1 / \sqrt{2}$ and then we shall have this is $1 / \sqrt{2}$; $2 / \sqrt{2}$ will be root

2. So, $z^2 - z$ is $\sqrt{2} + 1$ and $\sqrt{3} - 4z$ over $z - 1$.

So, this how we found the find the Z transform of this sequence even by using the linearity property and the standard formulae for Z transform of n Z transform of $\sin n\theta$ Z transform of a^n . So, as I said we have to remember the Z transform of some special sequences here which we shall need to find the Z transform of other sequences and these will also help when we solve the difference equations.

So, in the next lecture we shall discuss some more properties of the Z transforms like initial value theorem, final value theorem and one more theorem is that which is multiplication by n . So, we will discuss some more properties in our next lecture on properties of Z transforms. With that I would like to conclude my lecture.

Thank you very much for your attention.
