**System of Nonlinear Equations**

Hello everyone so welcome to the last lecture of the 2<sup>nd</sup> module of this course. In the past lectures in this module we have learned that how to solve a non-linear equation in particular for finding the roots of non-linear equations we learned several methods including bisection method then Regular Falsi and Secant method. Later on we have have gone to the Newton Raphson method and finally fixed point iterations methods. In today's lecture we will learn about how to solve a system of non-linear equations. In particular we will focus on 2 methods that is Newton Raphson and fixed point iterations for doing this job.

(Refer Slide Time: 1:26)

The slide is titled "Nonlinear System" in a blue header. Below the header, there is a box titled "System of nonlinear equations". Inside this box, it states: "The system of  $n$  non-linear equations having  $n$  unknowns can be given by" followed by a list of equations:  $f_1(x_1, x_2, \dots, x_n) = 0$ ,  $f_2(x_1, x_2, \dots, x_n) = 0$ , a vertical ellipsis, and  $f_n(x_1, x_2, \dots, x_n) = 0$ . Below these equations, it says: "We can write above system as  $\mathbf{f}(\mathbf{x}) = \mathbf{0}$ , where  $\mathbf{x}$  is the vector of variables  $(x_1, x_2, \dots, x_n)$  and  $\mathbf{f}$  is the vector of functions  $(f_1, f_2, \dots, f_n)$ ." At the bottom of the slide, there are logos for IIT Roorkee and NPTEL Online Certification Course, and a page number "2" in the bottom right corner.

So 1<sup>st</sup> of all let me tell you what is a system of non-linear equations, so consider a system of  $n$  nonlinear equations having  $n$  unknowns and written as  $f_1$  of  $x_1, x_2, \dots, x_n$  equals to 0.  $f_2$  again a non-linear equation in  $x_1, x_2, \dots, x_n$  that is 0 and so on and finally  $n^{\text{th}}$  equation is  $f_n$  in  $x_1, x_2, \dots, x_n$  equals to 0, so here you can say we are having  $n$  equations each one is denoted by  $f_1, f_2$  up to  $f_n$  and then each one is having  $n$  number of unknown variables  $x_1, x_2$  up to  $x_n$ . So solving this non-linear system means we need to find out the values of  $x_1, x_2, \dots, x_n$  we satisfy all those equations.

Basically analytically it is very hard to solve and hence here we will I will introduce some numerical methods for solving these equations. So if I want to write this system into a vector

form, so just consider a vector  $\mathbf{f}$  which is a vector of functions  $f_1, f_2$  up to  $f_n$  and a vector  $\mathbf{x}$  which is a vector of unknown variables  $x_1, x_2, x_n$ . Then this system of non-linear equation can be written as  $\mathbf{f}(\mathbf{x}) = 0$ .

(Refer Slide Time: 2:57)

**Nonlinear System**

**System of nonlinear equations**

Using Taylor series expansion, each of the functions  $f_i$  can be expanded in the neighbourhood of vectors  $\mathbf{x}_i, i = 1, 2, \dots, n$  as follows

$$f_i(\mathbf{x} + \delta\mathbf{x}) = f_i(\mathbf{x}) + \sum_{j=1}^n \frac{\partial f_i}{\partial x_j} \delta x_j + \mathcal{O}(\delta\mathbf{x}^2). \quad (1)$$

- The matrix containing all the partial derivatives in (1) is called Jacobian matrix  $\mathbf{J}$ .

$$J_{ij} = \frac{\partial f_i}{\partial x_j}, \quad i, j = 1, \dots, n$$

IIT ROORKEE  
 NPTEL ONLINE  
 CERTIFICATION COURSE

3

Now using Taylor series expansion each of the function  $f_i$  where  $i$  is from 1 to  $n$  can be expanded in the neighborhood of the vectors  $\mathbf{x}_i$  that is  $x_1, x_2, x_n$ . So using the Taylor series expansion we can write  $f_i(\mathbf{x} + \delta\mathbf{x}) = f_i(\mathbf{x}) + \sum_{j=1}^n \frac{\partial f_i}{\partial x_j} \delta x_j + \text{higher order term}$ . Here you can notice that particular summation term comes out as a  $n$  by  $n$  matrix. So this particular matrix containing the partial derivative different  $f$  with respect to unknown variables  $x_1, x_2, x_n$  is called the Jacobian matrix. So the  $i^{th}$  entry that is an entry in  $i^{th}$  row and  $j^{th}$  column of this Jacobian matrix  $\mathbf{J}$  can be given as  $\frac{\partial f_i}{\partial x_j}$  that is partial derivative of  $i^{th}$  function  $f$  with respect to  $j^{th}$  variable.

(Refer Slide Time: 4:14)

### Nonlinear System

#### System of nonlinear equations

The equation (1) can be written in matrix form as:

$$\mathbf{f}(\mathbf{x} + \delta\mathbf{x}) = \mathbf{f}(\mathbf{x}) + \mathbf{J}\delta\mathbf{x} + \mathcal{O}(\delta\mathbf{x}^2).$$

Neglecting terms of order  $\delta\mathbf{x}^2$  and higher with setting  $\mathbf{f}(\mathbf{x} + \delta\mathbf{x}) = 0$ , we get the system of non-linear equations for corrections  $\delta\mathbf{x}$  that makes each  $f_i$  approximately zero. Thus, we have  $\mathbf{J}\delta\mathbf{x} = -\mathbf{f}(\mathbf{x})$

Finally, we add the corrections to the solution vector as

$$\mathbf{x}_{new} = \mathbf{x}_{old} + \delta\mathbf{x}$$

IT ROORKEE NPTEL ONLINE CERTIFICATION COURSE 4

### Nonlinear System

#### System of nonlinear equations

Using Taylor series expansion, each of the functions  $f_i$  can be expanded in the neighbourhood of vectors  $\mathbf{x}_i$ ,  $i = 1, 2, \dots, n$  as follows

$$f_i(\mathbf{x} + \delta\mathbf{x}) = f_i(\mathbf{x}) + \sum_{j=1}^n \frac{\partial f_i}{\partial x_j} \delta x_j + \mathcal{O}(\delta\mathbf{x}^2). \quad (1)$$

- The matrix containing all the partial derivatives in (1) is called Jacobian matrix  $\mathbf{J}$ .

$$J_{ij} = \frac{\partial f_i}{\partial x_j}, \quad i, j = 1, \dots, n$$

IT ROORKEE NPTEL ONLINE CERTIFICATION COURSE 3

We can write the equation 1 in matrix form as  $\mathbf{f}(\mathbf{x} + \delta\mathbf{x}) = \mathbf{f}(\mathbf{x}) + \mathbf{J}\delta\mathbf{x} + \text{second order and higher order terms}$ . So here you can notice here we were having a vector means  $f_1, f_2, f_3$ , so we have written it as  $\mathbf{f}(\mathbf{x})$  and then Jacobian matrix this is coming from the term summation  $\sum_{j=1}^n \frac{\partial f_i}{\partial x_j} \delta x_j$ , so for  $i^{\text{th}}$  equation will be like  $\frac{\partial f_i}{\partial x_1} \delta x_1 + \frac{\partial f_i}{\partial x_2} \delta x_2 + \dots + \frac{\partial f_i}{\partial x_n} \delta x_n$  and so on up to  $n^{\text{th}}$ , so we have written it in matrix form in this way. Now as we are assuming that  $\delta\mathbf{x}$  is a small quantity, so we can neglect the  $2^{\text{nd}}$  order and higher order term and moreover the left-hand side  $\mathbf{f}(\mathbf{x} + \delta\mathbf{x})$  we can set it to 0.

So we get the system of non-linear equation for corrections  $\delta\mathbf{x}$  that makes each  $f_i$  approximately 0 thus we have since this left-hand side is 0, so we can write  $\mathbf{J}\delta\mathbf{x} = -\mathbf{f}(\mathbf{x})$

equals to minus of  $f(x)$ . So here you can notice we are having this system here Jacobian matrix is known to us for a given  $x$  or for a given vector  $x_1, x_2, \dots, x_n$  and so we know the  $f$  of  $x$  and hence it is coming out as a system of linear equations. After solving this system of linear equation we add the correction to the older solution that is  $x_{\text{new}}$  is equal to  $x_{\text{old}}$  plus  $\Delta x$  and in this way we update our iterations. So let us modify this particular thing into combination of Newton Raphson method for solving the system of non-linear equations.

(Refer Slide Time: 6:34)

**Nonlinear System**

**System of nonlinear equations**

In case of a single variable, Newton-Raphson method was obtained using the linear approximation of function  $f$  around a initial point  $x_0$ . Now, the linear approximation of vector function  $f$  around vectors  $x_0$  is given by

$$f(x) \approx f(x_0) + J(x_0)(x - x_0)$$

where  $J(x_0)$  is a  $n \times n$  matrix containing the partial derivatives of components of  $f$ .

IIT ROORKEE  
 NPTEL ONLINE  
 CERTIFICATION COURSE

5

So in case of a single variable Newton Raphson method was obtain using the linear approximation of function  $f$  around an initial point  $x_0$ . So in case of a system of non-linear equations can write the linear approximation of vector function  $f$  around the unknown variables vector  $x_0$  in this way that is  $f(x)$  equals to  $f(x_0)$  plus  $J(x_0)(x - x_0)$  where  $J(x_0)$  is  $n$  by  $n$  matrix and as you know it is the Jacobian matrix which is forming using the partial derivatives of  $f$ .

(Refer Slide Time: 7:16)

Nonlinear System

System of nonlinear equations

$$J(\mathbf{x}_0) = \begin{pmatrix} \frac{\partial f_1}{\partial x_1}(\mathbf{x}_0) & \frac{\partial f_1}{\partial x_2}(\mathbf{x}_0) & \cdots & \frac{\partial f_1}{\partial x_n}(\mathbf{x}_0) \\ \frac{\partial f_2}{\partial x_1}(\mathbf{x}_0) & \frac{\partial f_2}{\partial x_2}(\mathbf{x}_0) & \cdots & \frac{\partial f_2}{\partial x_n}(\mathbf{x}_0) \\ \vdots & \vdots & \ddots & \vdots \\ \frac{\partial f_n}{\partial x_1}(\mathbf{x}_0) & \frac{\partial f_n}{\partial x_2}(\mathbf{x}_0) & \cdots & \frac{\partial f_n}{\partial x_n}(\mathbf{x}_0) \end{pmatrix}$$

6

So like this one  $\frac{\partial f_1}{\partial x_1}$  over  $\frac{\partial f_1}{\partial x_2}$  up to  $\frac{\partial f_1}{\partial x_n}$  then we are having in the second row we are having the partial derivatives of the function  $f_2$  with respect to  $x_1, x_2$  up to  $x_n$  and so on in the last we are having the partial derivative of  $f_n$  with respect to  $x_1, x_2$  up to  $x_n$ .

(Refer Slide Time: 7:41)

System of nonlinear equations

System of nonlinear equations using Newton-Raphson method

We have to find  $\mathbf{x}$  so that  $\mathbf{f}(\mathbf{x}) = 0$ .  
 Choose  $\mathbf{x}_1$  such that

$$\mathbf{f}(\mathbf{x}_0) + \mathbf{J}(\mathbf{x}_0)(\mathbf{x}_1 - \mathbf{x}_0) = 0$$

Here,  $\mathbf{J}(\mathbf{x}_0)$  is a square matrix so, above equation can be written as

$$\mathbf{x}_1 = \mathbf{x}_0 - (\mathbf{J}(\mathbf{x}_0))^{-1}\mathbf{f}(\mathbf{x}_0)$$

with the condition that  $(\mathbf{J}(\mathbf{x}_0))^{-1}$  must exist.  
 The above method is same as the Newton-Raphson method discussed earlier.

7

Now we have to find  $\mathbf{x}$  so that the system  $\mathbf{f}(\mathbf{x})$  becomes 0. So choose  $\mathbf{x}_1$  such that  $\mathbf{f}(\mathbf{x}_0) + \mathbf{J}(\mathbf{x}_0)(\mathbf{x}_1 - \mathbf{x}_0) = 0$ . Please note that here all these  $\mathbf{f}(\mathbf{x}_0), \mathbf{x}_1 - \mathbf{x}_0$  all these are vectors and  $\mathbf{J}$  is a matrix  $n$  by  $n$  matrix and so on. So here  $\mathbf{J}(\mathbf{x}_0)$  is a square matrix so we can write the system in this way where  $\mathbf{x}_1$  equals to  $\mathbf{x}_0$  minus inverse of  $\mathbf{J}$  into  $\mathbf{f}$  of

$\mathbf{x}$  naught. However we can write in this way only when the inverse of  $\mathbf{J}$  exists and this method is called Newton Raphson method for the system of non-linear equations.

So in algorithmic way we can use this method provided inverse of  $\mathbf{J}$  exist but suppose you are having hundred equations with hundred unknowns it means the size of  $\mathbf{J}$  will become hundred times hundred and hence finding the inverse of hundred times hundred matrix is not an easy job in terms of computation complexity.

(Refer Slide Time: 9:01)

System of nonlinear equations

System of nonlinear equations using Newton-Raphson method

- However, we need not have to find the inverse  $(\mathbf{J}(\mathbf{x}_0))^{-1}$ .
- If  $\mathbf{x}_1 - \mathbf{x}_0 = \Delta \mathbf{x}$ ,  $\mathbf{J}(\mathbf{x}_0)\Delta \mathbf{x} = -\mathbf{f}(\mathbf{x}_0)$ .
- We know  $\mathbf{J}(\mathbf{x}_0)$  and  $\mathbf{f}(\mathbf{x}_0)$ , so, the above equation will be a system of linear equations.
- After obtaining  $\Delta \mathbf{x}$ , the new solution vector will be  $\mathbf{x}_1 = \mathbf{x}_0 + \Delta \mathbf{x}$

 IIT ROORKEE
  NPTEL ONLINE CERTIFICATION COURSE

8

System of nonlinear equations

System of nonlinear equations using Newton-Raphson method

We have to find  $\mathbf{x}$  so that  $\mathbf{f}(\mathbf{x}) = 0$ .  
 Choose  $\mathbf{x}_1$  such that

$$\mathbf{f}(\mathbf{x}_0) + \mathbf{J}(\mathbf{x}_0)(\mathbf{x}_1 - \mathbf{x}_0) = 0$$

Here,  $\mathbf{J}(\mathbf{x}_0)$  is a square matrix so, above equation can be written as

$$\mathbf{x}_1 = \mathbf{x}_0 - (\mathbf{J}(\mathbf{x}_0))^{-1}\mathbf{f}(\mathbf{x}_0)$$

with the condition that  $(\mathbf{J}(\mathbf{x}_0))^{-1}$  must exist.  
 The above method is same as the Newton-Raphson method discussed earlier.

 IIT ROORKEE
  NPTEL ONLINE CERTIFICATION COURSE

7

So we can use an alternate instead of finding the inverse of  $\mathbf{J}$ , what we will do that we will write  $\mathbf{x}_1 - \mathbf{x}_0$  as the  $\Delta \mathbf{x}$ , so  $\Delta \mathbf{x}$  is the vector of differences in the 2 iterations let us say in 1<sup>st</sup> and 2<sup>nd</sup> iteration and then  $\mathbf{J} \mathbf{x}$  naught will become we can write the this scheme as  $\mathbf{J} \mathbf{x}$  naught into  $\Delta \mathbf{x}$  equals to minus  $\mathbf{f} \mathbf{x}$  naught. We know  $\mathbf{J}$  for a given  $\mathbf{x}$  naught as well as

f for a given  $x_{n+1}$ , so the above system will become a system of  $l$  linear equation with  $n$  unknowns and hence once we can get this system we can solve it using any scheme which I have told you in the module 1 like Jacoby or Gauss Seidel those kind of approaches. Once you find  $x_{n+1}$  using any one of the iterative scheme for the linear equation you can obtain  $\Delta x$  and from the  $\Delta x$  the new solution can be obtained using  $x_{n+1} = x_n + \Delta x$ .

(Refer Slide Time: 10:17)

System of nonlinear equations

System of nonlinear equations using Newton-Raphson method

Thus, we solve

$$J(x_i)\Delta x = -f(x_i)$$

for  $\Delta x$  and find the new solution vector iteratively using

$$x_{n+1} = x_n + \Delta x \quad (2)$$

IT ROORKEE NPTEL ONLINE CERTIFICATION COURSE 9

So in brief we can say if we are having the  $i^{\text{th}}$  vector  $x_i$  that is in the  $i^{\text{th}}$  iteration we will solve this particular equation  $J$  of  $x_i$  into  $\Delta x$  equals to minus  $f$  of  $x_i$  and by solving this we will find  $\Delta x$  and vector  $x$  in next iteration will become  $x_n + \Delta x$ . So let us take an example of this system.

(Refer Slide Time: 10:55)

System of nonlinear equations

Example on system of nonlinear equations

Consider the system of non-linear equations

$$3x_1 - \cos(x_2 x_3) - \frac{1}{2} = 0$$

$$x_1^2 - 81(x_2 + 0.1)^2 + \sin(x_3) + 1.06 = 0$$

$$e^{-x_1 x_2} + 20x_3 + \frac{10\pi - 3}{3} = 0$$

Let  $x_0 = (0.1, 0.1, -0.1)^T$ .

IT ROORKEE NPTEL ONLINE CERTIFICATION COURSE 10

So here we are having 3 equations in 3 unknowns, so the 1<sup>st</sup> equation is 3 times x 1 minus cost of x 2 x 3 minus half equals to 0. The 2<sup>nd</sup> equation is given as x 1 square minus 81 times x 2 plus 0.1 whole square plus sin x 3 plus 1.06 equal to 0 and the 3<sup>rd</sup> equation is e raise to power minus x 1 x 2 plus 20 x 3 plus 10 pi minus 3 upon 3 equals to 0. So here you can note down at each of the equation is a transcendental equation like in 1<sup>st</sup> equation we are having cos sign term similarly in the 2<sup>nd</sup> equation we are having a sin term and the 3<sup>rd</sup> equation we are having an exponential term. Let us solve this system of transcendental equations with an initial guess 0.1, 0.1 and minus 0.1.

(Refer Slide Time: 11:52)

**System of nonlinear equations**

**Example on system of nonlinear equations**

Let  $f = (f_1, f_2, f_3)^T$ ;  $f_1(x_1, x_2, x_3) = 3x_1 - \cos(x_2 x_3) - \frac{1}{2}$ ,

$$f_2(x_1, x_2, x_3) = x_1^2 - 81(x_2 + 0.1)^2 + \sin(x_3) + 1.06,$$

$$f_3(x_1, x_2, x_3) = e^{-x_1 x_2} + 20x_3 + \frac{10\pi - 3}{3}$$

The Jacobian matrix  $J(\mathbf{x})$  for this system is

$$\begin{bmatrix} 3 & x_3 \sin(x_2 x_3) & x_2 \sin(x_2 x_3) \\ 2x_1 & -162(x_2 + 0.1) & \cos(x_3) \\ -x_2 e^{-x_1 x_2} & -x_1 e^{-x_1 x_2} & 20 \end{bmatrix}$$

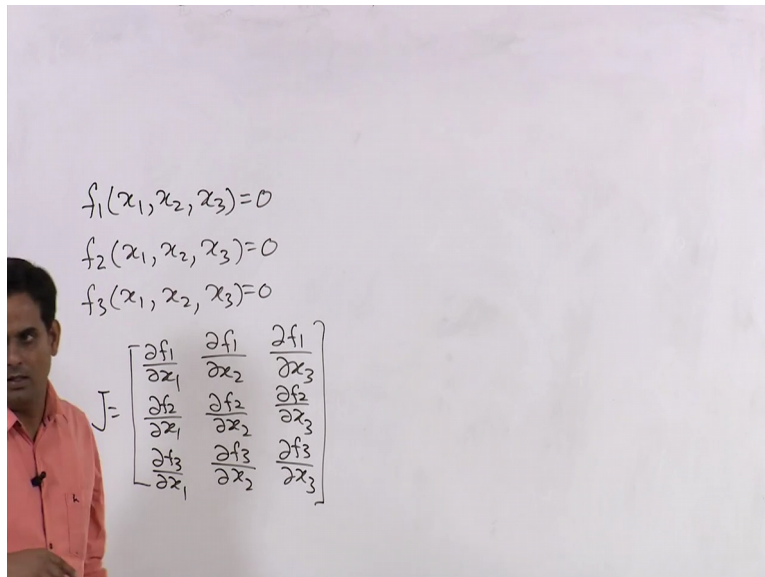

IIT ROORKEE  
NPTEL ONLINE CERTIFICATION COURSE

11

It means in the as an initial solution we will take x 1 as 0.1, x 2 as 0.1 and x 3 as minus 0.1. So now let us assume the 1<sup>st</sup> equation is f 1 that is this equation is a function of f 1 x 1, x 2 and x 3 similarly 2<sup>nd</sup> equation let us f 2 and 3<sup>rd</sup> equation is f 3, so we can write in this way and hence first of all we need to find out the Jacobian of this system.

(Refer Slide Time: 12:30)

$$\begin{aligned}
 f_1(x_1, x_2, x_3) &= 0 \\
 f_2(x_1, x_2, x_3) &= 0 \\
 f_3(x_1, x_2, x_3) &= 0
 \end{aligned}$$

$$J = \begin{bmatrix} \frac{\partial f_1}{\partial x_1} & \frac{\partial f_1}{\partial x_2} & \frac{\partial f_1}{\partial x_3} \\ \frac{\partial f_2}{\partial x_1} & \frac{\partial f_2}{\partial x_2} & \frac{\partial f_2}{\partial x_3} \\ \frac{\partial f_3}{\partial x_1} & \frac{\partial f_3}{\partial x_2} & \frac{\partial f_3}{\partial x_3} \end{bmatrix}$$

So for finding the Jacobian of the system we are having a system like  $f_1(x_1, x_2, x_3) = 0$ ,  $f_2(x_1, x_2, x_3) = 0$  and then  $f_3(x_1, x_2, x_3) = 0$ . Now the Jacobian matrix will be a 3 by 3 matrix which will be having  $\frac{\partial f_1}{\partial x_1}$  then this element will be  $\frac{\partial f_1}{\partial x_2}$ ,  $\frac{\partial f_1}{\partial x_3}$ . In the same way in the 2<sup>nd</sup> row we will be having instead of  $f_1$  function  $f_2$ , so  $\frac{\partial f_2}{\partial x_1}$ ,  $\frac{\partial f_2}{\partial x_2}$  and then  $\frac{\partial f_2}{\partial x_3}$ . In the final row you will be having function  $f_3$  that is a partial derivative slope  $f_3$  with respect to  $x_1$ ,  $x_2$  and  $x_3$ .

(Refer Slide Time: 13:54)

System of nonlinear equations

Example on system of nonlinear equations

Let  $f = (f_1, f_2, f_3)^T$ ;  $f_1(x_1, x_2, x_3) = 3x_1 - \cos(x_2x_3) - \frac{1}{2}$ ,

$$f_2(x_1, x_2, x_3) = x_1^2 - 81(x_2 + 0.1)^2 + \sin(x_3) + 1.06,$$

$$f_3(x_1, x_2, x_3) = e^{-x_1x_2} + 20x_3 + \frac{10\pi - 3}{3}$$

The Jacobian matrix  $J(\mathbf{x})$  for this system is

$$\begin{bmatrix} 3 & x_3 \sin(x_2x_3) & x_2 \sin(x_2x_3) \\ 2x_1 & -162(x_2 + 0.1) & \cos(x_3) \\ -x_2 e^{-x_1x_2} & -x_1 e^{-x_1x_2} & 20 \end{bmatrix}$$

NPTEL ONLINE  
CERTIFICATION COURSE

11

So hence Jacobian matrix will be a 3 by 3 matrix and here  $\frac{\partial f_1}{\partial x_1}$  will become 3,  $\frac{\partial f_1}{\partial x_2}$  will become minus minus will become plus sign  $x_2 x_3$  into  $x$

3, so  $x_3 \sin x_2 x_3$ . Similarly  $\frac{\partial f_1}{\partial x_3}$  will become  $x_2 \sin x_2 x_3$  this will be the partial derivatives slope  $f_2$  with respect to  $x_1$  with respect to  $x_2$  and with respect to  $x_3$  and the final row is having partial derivative of  $f_3$  with respect to  $x_1$ ,  $x_2$  and then  $x_3$ .

(Refer Slide Time: 14:32)

**System of nonlinear equations**

**Example on system of nonlinear equations**  
Consider the system of non-linear equations

$$3x_1 - \cos(x_2 x_3) - \frac{1}{2} = 0$$

$$x_1^2 - 81(x_2 + 0.1)^2 + \sin(x_3) + 1.06 = 0$$

$$e^{-x_1 x_2} + 20x_3 + \frac{10\pi - 3}{3} = 0$$

Let  $\mathbf{x}_0 = (0.1, 0.1, -0.1)^t$ .

 IIT ROORKEE
  NPTEL ONLINE CERTIFICATION COURSE
 10

**System of nonlinear equations**

**Example on system of nonlinear equations**  
 $\mathbf{f}(\mathbf{x}_0) = (-0.199995, -2.269833417, 8.462025346)^t$  and,

$$\mathbf{J}(\mathbf{x}_0) = \begin{bmatrix} 3 & 9.999833334 \times 10^{-4} & 9.999833334 \times 10^{-4} \\ 0.2 & -32.4 & 0.9950041653 \\ -0.09900498337 & -0.09900498337 & 20 \end{bmatrix}$$

Let  $\Delta \mathbf{x} = \mathbf{y}_0$ . Solving the linear system  $\mathbf{J}(\mathbf{x}_0)\mathbf{y}_0 = -\mathbf{f}(\mathbf{x}_0)$ , we have

$$\mathbf{y}_0 = \begin{bmatrix} 0.3998696728 \\ -0.08053315147 \\ -0.4215204718 \end{bmatrix} \text{ and } \mathbf{x}_1 = \mathbf{x}_0 + \mathbf{y}_0 = \begin{bmatrix} 0.4998696728 \\ 0.01946684853 \\ -0.5215204718 \end{bmatrix}$$

 IIT ROORKEE
  NPTEL ONLINE CERTIFICATION COURSE
 12

Now what I will do I will put these values in the Jacobian matrix that is  $x_1$  0.1,  $x_2$  0.1 and  $x_3$  minus 0.1, so the Jacobian matrix or initial Jacobian matrix I will say become like this moreover for the initial solution 0.1, 0.1 and minus 0.1 the value of  $f_1$ ,  $f_2$ ,  $f_3$  is given by these 3 numbers, so I am having  $\mathbf{J}$  of  $\mathbf{x}$  naught,  $\mathbf{f}$  of  $\mathbf{x}$  naught. So what I will do, I will solve the system  $\mathbf{J}$  of  $\mathbf{x}$  naught into  $\Delta \mathbf{x}$  equals to minus  $\mathbf{f}$  of  $\mathbf{x}$  naught and after solving this I will get the solution for  $\Delta \mathbf{x}$  like this that is  $\Delta x_1$  will become 0.39986  $\Delta x_2$  will become minus 0.080533 and  $\Delta x_3$  will become this number, so this is the change which

we need to made in initial solution to getting the update in 1<sup>st</sup> equation. So adding this in the initial solution, I will get this solution that is 0.479, 0.019 and minus 0.521 as my 1<sup>st</sup> means solution of x in 1<sup>st</sup> iteration that is I will denote it as  $x_1$ .

(Refer Slide Time: 15:57)

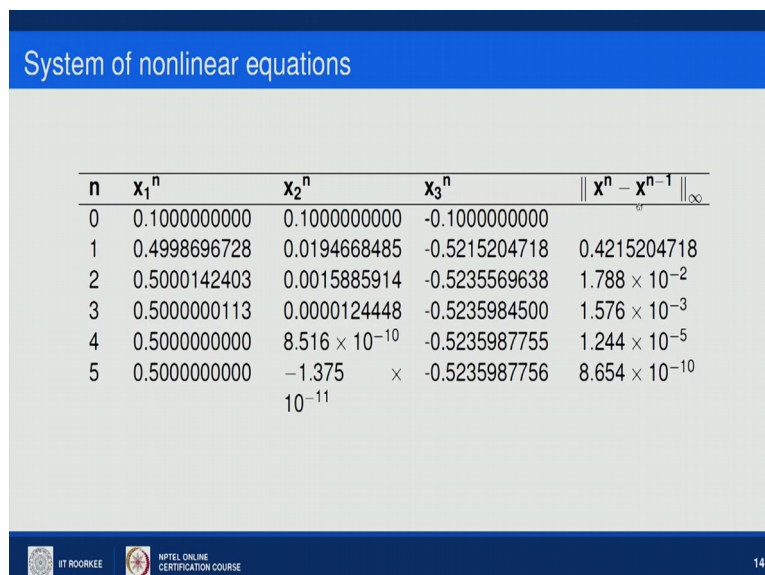

System of nonlinear equations

Example on system of nonlinear equations

Using (2), we can find  $x_2, x_3, \dots$  The iterations are shown in the following table.

So continuing this now I will use this  $x_1$  and I will find  $x_2$ , so it means I need to solve system  $J$  of  $x_1$  into  $\Delta x$  equals to minus  $f$  of  $x_1$  and hence from there I will get  $x_2$  that is  $x_2$  will be  $x_1$  plus this  $\Delta x$  which I get using solving this system.

(Refer Slide Time: 16:24)

System of nonlinear equations

So hence this stable so the iterations in for various for various  $n$  like earlier initial solution was 0.1, 0.1, minus 0.1 then this is the solution getting in 1<sup>st</sup> equation. The last column of the

table shows the norm of the difference of the two vectors  $x$  of 10 in successive iteration means in current iteration and in the previous iterations. So for the 2<sup>nd</sup> iteration I will get  $x_1$  as 0.5 then this is  $x_2$  and this is  $x_3$  and here this difference will be of order  $10^{-2}$ . In the 3<sup>rd</sup> equation these are the values and difference is of  $10^{-3}$ .

On the 4<sup>th</sup> iteration difference means these are the values and differences of  $10^{-5}$ . So here you can notice the difference is increasing it means accuracy we are moving towards the exact solution. So in the 5<sup>th</sup> iteration these are the numbers value for  $x_1$ ,  $x_2$  and  $x_3$  and the differences is of order  $10^{-10}$ , hence this is the vector  $x$  which is very close to the exact solution and in this way using the successive iterations we can get the numerical solution of  $x$  for a system of non-linear equation using the Newton Raphson method.

(Refer Slide Time: 18:13)

System of nonlinear equations

- The above example shows that Newton-Raphson method converges fastly if we initially have good approximation.
- But it is not possible always to find good starting value.
- In those cases, the method will become costly to apply.

IT ROOKIE NPTEL ONLINE CERTIFICATION COURSE 15

So the above example shows that Newton Raphson method converges fastly if we initially have a good approximation means our initial solution is close to the exact solution but it is not possible always to find a good initial solution for a given problem, so in those cases the method will become costly to apply. So for this we will take the another method that is the fixed point iteration method like the earlier which we have done for a single non-linear equation, we will extend it for a system of non-linear equations.

(Refer Slide Time: 18:50)

System of nonlinear equations

Using Fixed point iteration method

The system of  $n$  non-linear equations having  $n$  unknowns can be given by

$$\begin{aligned}f_1(x, y, \dots, z) &= 0 \\f_2(x, y, \dots, z) &= 0 \\&\vdots \\f_n(x, y, \dots, z) &= 0\end{aligned}$$

We can write above system as  $\mathbf{f}(\mathbf{x}) = \mathbf{0}$ , where  $\mathbf{x}$  is the vector of variables  $(x, y, \dots, z)$  and  $\mathbf{f}$  is the vector of functions  $(f_1, f_2, \dots, f_n)$ .

16

And here again consider a system of  $n$  nonlinear equations with  $n$  unknowns is given by this equations here just I have changed the variables, so here  $n$  variables are  $x, y$  up to  $z$  and like that functions are  $f_1, f_2, f_n$ , so we can write this system again in a vector form like this  $\mathbf{f}$  of  $\mathbf{x}$  equals to  $\mathbf{0}$ , where  $\mathbf{f}$  is the vector of functions  $f_1, f_2, f_n$  and  $\mathbf{x}$  is the vector of variables  $x, y$  up to  $z$  that is  $n$  variables.

(Refer Slide Time: 19:24)

System of nonlinear equations

Using Fixed point iteration method

Let  $(x_0, y_0, \dots, z_0)$  be the initial approximation. Then, the fixed point iterations for the given non-linear system of equations is

$$\begin{aligned}x_{i+1} &= g_1(x_i, y_i, \dots, z_i) \\y_{i+1} &= g_2(x_i, y_i, \dots, z_i) \\&\vdots \\z_{i+1} &= g_n(x_i, y_i, \dots, z_i)\end{aligned}$$

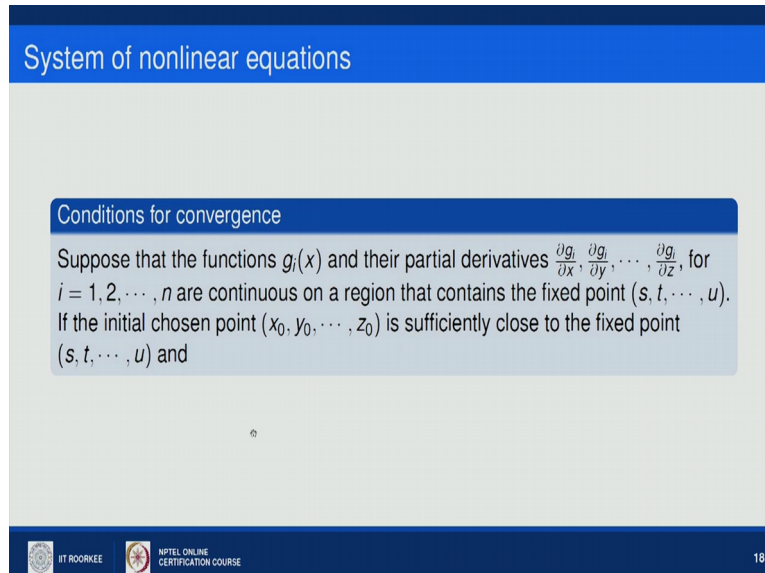

which converges to  $(s, t, \dots, u)$  for all  $i = 1, 2, \dots, n$ .

17

Now if I take the initial approximation as  $x$  naught,  $y$  naught,  $z$  naught, then the fixed point iteration for the given non-linear system of equation is given in this way, so here you can notice that we are having  $g_1, g_2, g_n$ . So like you are having the 1<sup>st</sup> non-linear equation, so you have 2 write the 1<sup>st</sup> non-linear equation that is  $f_1$  of  $x$  equals to 0 in such a way that  $x$

equals to  $g_1$  of  $x$ . Similarly for 2<sup>nd</sup> equation and rest of the equations, so in the case of a single non-linear equation I told you what is the criteria for writing such a  $g$ , so that our method converge. So we need to write in this way which converge to the numerical solution  $s, t, u$  for  $i$  equals to 1, 2,  $n$ .

(Refer Slide Time: 20:22)

The slide is titled "System of nonlinear equations". It contains a section titled "Conditions for convergence" which states: "Suppose that the functions  $g_i(x)$  and their partial derivatives  $\frac{\partial g_i}{\partial x}, \frac{\partial g_i}{\partial y}, \dots, \frac{\partial g_i}{\partial z}$ , for  $i = 1, 2, \dots, n$  are continuous on a region that contains the fixed point  $(s, t, \dots, u)$ . If the initial chosen point  $(x_0, y_0, \dots, z_0)$  is sufficiently close to the fixed point  $(s, t, \dots, u)$  and

At the bottom of the slide, there are logos for "IIT ROORKEE" and "NPTEL ONLINE CERTIFICATION COURSE", and the page number "18".

Now what is the condition for convergence in this case, so that is given by this particular result that is suppose that the functions  $g_1, g_2, g_n$  of  $x$  and their partial derivatives with respect to various unknown variables  $x, y$  up to  $z$  for  $i$  equals to 1, 2,  $n$  are continuous on a region that contains the fixed point  $s, t$  up to  $u$ . So here what we are saying that the region where you are having your initial solution partial derivatives your  $g$ . Your  $g$  should be continuous, partial derivative should be continuous on the same region and your fixed point also lies in the same domain.

(Refer Slide Time: 21:27)

**System of nonlinear equations**

**Conditions for convergence**

$$\left| \frac{\partial g_1}{\partial x}(s, t, \dots, u) \right| + \left| \frac{\partial g_1}{\partial y}(s, t, \dots, u) \right| + \dots + \left| \frac{\partial g_1}{\partial z}(s, t, \dots, u) \right| < 1,$$

$$\left| \frac{\partial g_2}{\partial x}(s, t, \dots, u) \right| + \left| \frac{\partial g_2}{\partial y}(s, t, \dots, u) \right| + \dots + \left| \frac{\partial g_2}{\partial z}(s, t, \dots, u) \right| < 1,$$

$$\vdots$$

$$\left| \frac{\partial g_n}{\partial x}(s, t, \dots, u) \right| + \left| \frac{\partial g_n}{\partial y}(s, t, \dots, u) \right| + \dots + \left| \frac{\partial g_n}{\partial z}(s, t, \dots, u) \right| < 1.$$

Then, the fixed point iterations defined earlier converges to the fixed point  $(s, t, \dots, u)$ .

BT ROORKEE NPTEL ONLINE CERTIFICATION COURSE 19

So if the initial chosen point is  $x$  naught,  $y$  naught,  $z$  naught is sufficiently close to the fixed point  $s, t, u$  and the partial derivative of  $g_1$  with respect to 1<sup>st</sup> unknown variables at the fixed point plus partial derivative of the  $g_1$  with respect to 2<sup>nd</sup> unknown variable and so on partial derivative of  $g_1$  with respect to  $n^{\text{th}}$  unknown variable and absolute sum of all these terms should be less than 1. Similarly for  $g_2$  similarly for  $n^{\text{th}}$ ,  $g_n$  then the fixed point iteration defined earlier converges to the fixed point  $s, t, u$ .

(Refer Slide Time: 22:01)

**System of nonlinear equations**

**Example**

Consider the system of equations

$$f_1(x, y) = x^2 - 2x - y + 0.5 = 0$$

$$f_2(x, y) = x^2 + 4y^2 - 4 = 0$$

The equivalent system of equations is

$$x = \frac{x^2 - y + 0.5}{2}, \quad y = \frac{-x^2 - 4y^2 + 8y + 4}{8}$$

Starting with the initial point  $(x_0, y_0)$ , we have the sequence  $(x_{i+1}, y_{i+1})$  as

$$x_{i+1} = \frac{x_i^2 - y_i + 0.5}{2}, \quad y_{i+1} = \frac{-x_i^2 - 4y_i^2 + 8y_i + 4}{8}$$

BT ROORKEE NPTEL ONLINE CERTIFICATION COURSE 20

So for this let us take an example again, so here we are taking an example of 2 equations in 2 unknowns, so 1<sup>st</sup> equation is  $x$  square minus  $2x$  minus  $y$  plus  $0.5$  equals to  $0$ , 2<sup>nd</sup> equation is  $x$  square plus  $4y$  square minus  $4$  equals to  $0$ , so now we are writing the 1<sup>st</sup> equation in the form

as  $x$  equals to  $g_1(x)$ , so here we can choose we can write this equation like  $x$  equals to  $x^2 - y + 0.5$ , so what we have done we have taken this  $-2x$  term into right-hand side and then  $x$  will become half of  $x^2 - y + 0.5$ .

Similarly we need to write the 2<sup>nd</sup> equation as the 2<sup>nd</sup> unknown variable equals to  $g_2$  of function of all unknown variable. So here we are writing it as  $y$  equals to  $-x^2 - 4y^2 + 8y + 4$ , so starting with the initial point  $x=0, y=0$ , we have the sequence  $x_{i+1}, y_{i+1}$  as as you did it in case of a single non-linear equation do it separately for this  $g_1(x)$  as well as for  $g_2(x)$ , so we get this iterative scheme. Now start with an initial value of  $x$  and  $y$  and then you can get the successive approximation of  $x$  as well as  $y$  which converge towards the fixed point, so let us check the convergence condition.

(Refer Slide Time: 23:55)

System of nonlinear equations

Example

The partial derivatives are

$$\frac{\partial}{\partial x} g_1(x, y) = x, \quad \frac{\partial}{\partial y} g_1(x, y) = -\frac{1}{2},$$

$$\frac{\partial}{\partial x} g_2(x, y) = -\frac{x}{4}, \quad \frac{\partial}{\partial y} g_2(x, y) = -y + 1.$$

For all  $(x, y)$  satisfying  $-0.5 < x < 0.5$  and  $0.5 < y < 1.5$ , the partial derivatives satisfy

$$\left| \frac{\partial}{\partial x} g_1(x, y) \right| + \left| \frac{\partial}{\partial y} g_1(x, y) \right| = |x| + |-0.5| < 1,$$

$$\left| \frac{\partial}{\partial x} g_2(x, y) \right| + \left| \frac{\partial}{\partial y} g_2(x, y) \right| = \frac{|-x|}{4} + |-y + 1| < 0.625 < 1,$$

## System of nonlinear equations

### Example

Consider the system of equations

$$f_1(x, y) = x^2 - 2x - y + 0.5 = 0$$

$$f_2(x, y) = x^2 + 4y^2 - 4 = 0$$

The equivalent system of equations is

$$x = \frac{x^2 - y + 0.5}{2}, \quad y = \frac{-x^2 - 4y^2 + 8y + 4}{8}$$

Starting with the initial point  $(x_0, y_0)$ , we have the sequence  $(x_{i+1}, y_{i+1})$  as

$$x_{i+1} = \frac{x_i^2 - y_i + 0.5}{2}, \quad y_{i+1} = \frac{-x_i^2 - 4y_i^2 + 8y_i + 4}{8}$$

IT ROORKEE

NITEL ONLINE  
CERTIFICATION COURSE

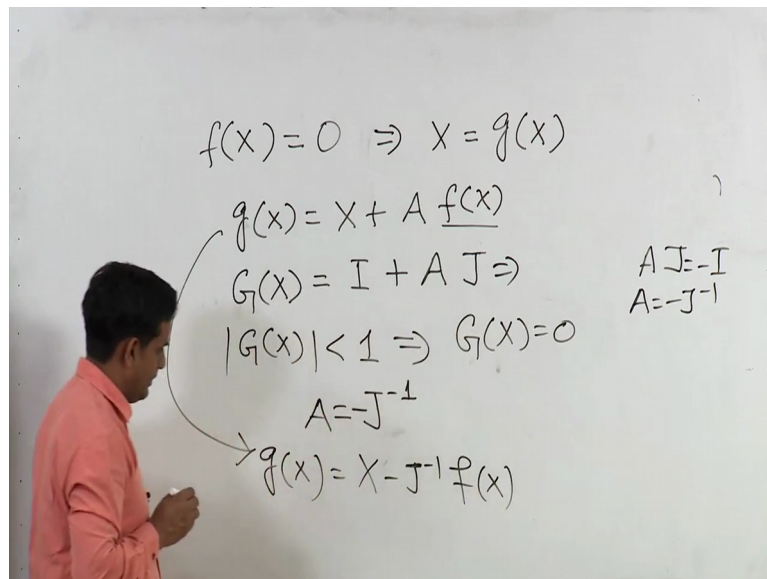

20

So here we are having these 2 functions, we have written it like this, so partial derivative of  $g_1$  with respect to  $x$  is given by  $2x$  upon  $2$  that will be  $x$  here. Similarly partial derivative of  $g_1$  with respect to  $y$  is given by, so this is my  $g_2$ . So this will be minus  $2x$  upon  $8$  sorry with respect to  $y$ , so it will become minus  $8y$  upon  $8$ , so it is  $g_1$  of  $y$  that is minus half  $g_2$  upon  $x$  minus  $x$  by  $4$  and  $g_2$  upon  $y$  will be minus  $y$  plus  $1$ , so if you not take this rectangular domain that is  $x$  is between minus  $0.5$  to  $0.5$  and  $y$  is in  $0.5$  to  $1.5$  then you can note down that the partial derivatives satisfy the convergence conditions that is  $\frac{\partial g_1}{\partial x} + \frac{\partial g_1}{\partial y}$  will be less than  $1$ . Similarly  $\frac{\partial g_2}{\partial x} + \frac{\partial g_2}{\partial y}$  will be less than  $1$  for all values of  $x$  and  $y$  belonging to this domain.

So here since if you choose any initial solution this rectangular domain then our system will converge to the fixed point of  $g_1$  and  $g_2$  and fixed point of this system will be minus  $0.22$  and  $0.99$  which is also in the given rectangular domain. Now the question is how to choose  $g$  in the system so that my method converge because as you know from the single equation, single non-linear equation when we did it using the fixed point iteration method we can have various choice of  $g$ . So as you know from the non-linear equation and the related fixed point iteration method that the choice of  $g$  is very important the convergence. The same case apply in case of system of non-linear equations, so here again choice of  $g$  is quite important.

(Refer Slide Time: 26:16)

The whiteboard contains the following equations:

$$f(x) = 0 \Rightarrow x = g(x)$$
$$g(x) = x + A f(x)$$
$$G(x) = I + A J \Rightarrow$$
$$|G(x)| < 1 \Rightarrow G(x) = 0$$
$$A = -J^{-1}$$
$$g(x) = x - J^{-1} f(x)$$

On the right side of the board, the following equations are written:

$$AJ = -I$$
$$A = -J^{-1}$$

So how to choose the best  $g$  let me explain here, so let us take we are having a system of non-linear equations and which is represented in matrix form as  $f$  of  $x$  equals to 0, so here  $f$  is a vector containing the functions  $f_1, f_2$  up to  $f_n$  and  $x$  is again a vector containing the variables  $x_1, x_2$  up to  $x_n$ . So we are having  $n$  number of non-linear equations in  $n$  unknown. Now the fixed point iteration method for this can be written as  $x$  equals to  $g$  of  $x$ .

Now what should be this  $g$  the best choice of  $g$ , so let me write this  $g$  as  $x$  that is the same equation plus a constant matrix  $A$  which is square matrix of order  $n$  into  $f$  of  $x$ . Since  $f$  of  $x$  equals to 0 so this term is 0 basically. Now if I differentiate it partially with respect to different  $x_1, x_2, x_n$  then it here let us take I am getting matrix capital  $G_x$ , this will come out as an identity matrix  $I$  plus  $A$  is a constant matrix, so it will be domain like this into the differentiation of this with respect to different  $x_1, x_2, x_n$ . So this as you know will become Jacobian matrix. Now so my capital  $G_x$  equals to  $I$  plus  $A$  into Jacobian that is the matrix containing the partial derivatives of different  $f$  with respect to different  $x$ . Now for the rapid convergence or for the convergence this  $G_x$  should be less than 1.

This gives me if I take  $G_x$  equals to 0 which is the minimum possible value of this  $G$  absolute value of  $G$ , I will get the rapid convergence or the best convergence. So if I put  $G_x$  equals to 0 here what am getting, I am getting  $A$  as the matrix  $J$  inverse because minus  $J$  inverse basically because this is 0, so I can write it 0 equals to  $I$  plus  $AJ$ , so I can write or  $AJ$  equals to minus  $I$  and then if I multiply by  $J$  inverse that is the post multiplication I will get  $A$  equals to minus  $J$  inverse. So  $A$  equals to minus  $J$  inverse so if I put here I will get  $g$  as  $x$  plus or it is minus or minus  $J$  inverse into  $f$ .

(Refer Slide Time: 29:58)

And what is this? This is because my iterative scheme is  $x_{n+1}$  of  $g$  of  $x_n$ , so if I write  $x_{n+1}$ ,  $x_n$  then what is this scheme? This is the Newton Raphson method for system of non-linear equations and hence the best choice of  $G$  gives me the fixed point iteration method same as the Newton Raphson method for the system of non-linear equations.

(Refer Slide Time: 30:50)

So when we do the find the extrema or maxima or minima of a system of more than one variable let us say this one, so let us take this function as  $x_2^2$  plus  $x_2 \sin$  of  $x_1$ . So let us say I need to find out the maximum or minima or extrema of this function, so here the necessary condition is that  $\frac{\partial f}{\partial x_1}$  as should be 0 and  $\frac{\partial f}{\partial x_2}$  should be 0,

so from this we find the points in the domain of  $x_1$  and  $x_2$  where we need to check the points for maxim or minima of the function  $f$ .

Basically we find the stationary points, so here if I do it so  $\frac{\partial f}{\partial x_1}$  gives me  $x_2^2$  square plus  $x_2 \cos$  of  $x_1$  equals to 0 and the 2<sup>nd</sup> equation gives me twice of  $x_1 x_2$  plus  $\sin$  of  $x_1$  equals to 0. So please note that, what is the system? This is a system of non-linear equations which we have discussed just now. So here you will find the system quite frequently and if we consider a problem of minima of this system and we apply the sufficient condition we will find that the Jacobian matrix should be invertible for having the maximum or minima of this system on the points of solution of this system.

So hence this is an application of system of non-linear equations. Now in this lecture we learned how to solve a system of more than 1 non-linear equations using the Newton Raphson as well as fixed point methods. This is the last this was the last lecture of the module 2 and now we will come to 3<sup>rd</sup> module in the next lecture, so we will start our 3<sup>rd</sup> module where we will discuss about numerical methods for finding the eigenvalues and Eigen vectors of a matrix. Thank you very much.
