**LU Decomposition**

Hello everyone so this is the 3<sup>rd</sup> lecture of this course and today I am going to introduce you another direct method for solving linear system that is called LU decomposition, so again the idea of this method LU decomposition is the same which we were having in case of Gaussian elimination that to convert the coefficient matrix in triangle matrix however in Gaussian elimination we were converting or reducing our matrix into an upper triangle matrix then we were using back substitution. Here the idea is to write the coefficient matrix as a product of lower and upper triangular matrices and then solve the linear system of equation using forward followed by the back substitutions.

(Refer Slide Time: 1:30)

**LU decomposition**

**Introduction**

Consider the system of equations

$$A\mathbf{x}=\mathbf{b}$$

- Also known as the **decomposition** method or the **factorization** method.
- Coefficient matrix **A** is decomposed into product of lower triangular and upper triangular matrices.
- We can write matrix **A** as

$$A = L U$$

where **L** is lower triangular matrix and **U** is upper triangular matrix given as

## LU Decomposition

### L and U Matrices

$$\mathbf{L} = \begin{bmatrix} l_{11} & 0 & 0 & \dots & 0 \\ l_{21} & l_{22} & 0 & \dots & 0 \\ l_{31} & l_{32} & l_{33} & \dots & 0 \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ l_{n1} & l_{n2} & l_{n3} & \dots & l_{nn} \end{bmatrix}, \mathbf{U} = \begin{bmatrix} u_{11} & u_{12} & u_{13} & \dots & u_{1n} \\ 0 & u_{22} & u_{23} & \dots & u_{2n} \\ 0 & 0 & u_{33} & \dots & u_{3n} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & 0 & \dots & u_{nn} \end{bmatrix}$$

- Usual matrix multiplication is used to multiply matrices  $\mathbf{L}$  and  $\mathbf{U}$ .

IIT ROORKEE

NPTEL ONLINE

3

So consider the system of equation  $Ax = b$  this also known as the decomposition or factorization method, so the coefficient matrix is decomposed or factorized into product of lower triangular and upper triangular matrices  $L$  and  $U$ , so  $A$  equals to  $L$  and  $U$ ,  $L$  into  $U$   $L$  is lower triangle matrix and  $U$  is the upper triangle matrix, so these 2 matrices are given as, as you can see it is  $n$  by  $n$  matrices and it is a lower triangular matrix because all the entries about the main diagonal are 0. Similarly  $U$  is an upper triangular matrix and here all the entries below the main diagonal are 0. We are using the usual matrix multiplication to multiply the matrices  $L$  and  $U$ .

(Refer Slide Time: 2:39)

$$Ax = b$$

$$A = LU$$

$$\begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix} = \begin{bmatrix} l_{11} & 0 & 0 \\ l_{21} & l_{22} & 0 \\ l_{31} & l_{32} & l_{33} \end{bmatrix} \begin{bmatrix} u_{11} & u_{12} & u_{13} \\ 0 & u_{22} & u_{23} \\ 0 & 0 & u_{33} \end{bmatrix}$$

$l_{ii} = 1$  when  $i = j$

$A_{n \times n}$   
 $\downarrow$   
 $n^2$   
 $=$

$n^2 + n$  unknowns

So basically what we are doing we are taking the system  $Ax = b$  but what we are doing at this moment we will focus on the decomposition of this coefficient matrix is the

product of 2 matrices  $L$  and  $U$ , so if we are having again a 3 by 3 system  $a_{11}$ ,  $a_{12}$ ,  $a_{13}$ ,  $a_{21}$ ,  $a_{22}$ ,  $a_{23}$ ,  $a_{31}$ ,  $a_{32}$ ,  $a_{33}$  this can be written as the product of a 3 by 3 lower triangle matrix, so this is the lower triangle matrix  $L$  into an upper triangle matrix  $U$ ,  $u_{11}$ ,  $u_{12}$ ,  $u_{13}$ ,  $0$ ,  $u_{22}$ ,  $u_{23}$ ,  $0$ ,  $0$ ,  $u_{33}$ . Now if you look in the left-hand side we are having total 9 entries, these 9 entries are known to us however in the right-hand side we are having total 12 entries, 6 from the matrix  $L$  and 6 from the matrix  $U$ .

Hence we multiply these 2 matrices and try to find out the values of all  $l_{ij}$  and  $u_{ij}$ , we will not be able to do because here we are having only 9 entries, so 9 equations and 12 unknowns, so what is the solution? So what is the solution to this problem? In general like can say this problem is like that if  $A$  is  $n$  by  $n$  matrix then I will be having total  $n$  square plus  $n$  unknowns because you can see in 1<sup>st</sup> row I will be having one, in 2<sup>nd</sup> row 2, in 3<sup>rd</sup> row 3, in  $n$ th row  $n$ , so it will be some  $1 + 2 + 3 + \dots + n$  that will be basically  $n$  into  $n + 1$  by 2.

So  $n$  into  $n + 1$  by 2 from the lower triangle matrix and in  $2n$  plus 1 by 2 from the upper triangle matrix total will become  $n$  square plus  $n$  unknowns including all  $l_{ij}$  and  $u_{ij}$ . While for a  $n$  by  $n$  matrix say I will be having only  $n$  square entries which is known to me. So somehow I need to reduce  $n$  unknowns, so what I will do? If I write the diagonal entry, entries of either from  $l$  or diagonal entries of  $u$  as 1 then the trick will work, so what I will do? Either I will choose these entries as 1, so  $l_{ij}$  equals to 1 when  $i$  equals to  $j$ , so what will happen? The  $n$  entries will become less here, so  $n$  number of unknowns be reduced, so  $n$  square unknown  $n$  square entries, I will get a unique solution or the LU factorisation or instead of this I can take all the diagonal entries of my upper triangular matrix as 1.

(Refer Slide Time: 7:25)

## LU decomposition

Doolittle and Crout's Schemes

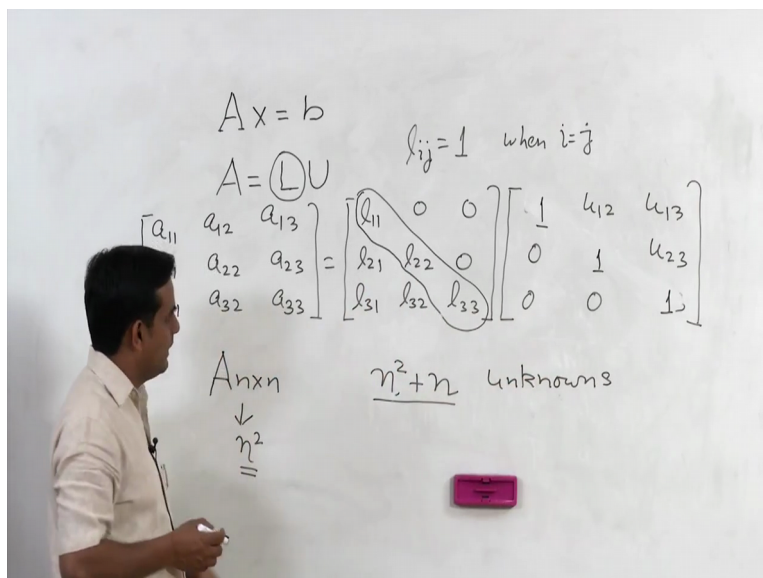

When we choose

- $l_{ij} = 1$ , the method is known as **Doolittle's** method.
- $u_{ij} = 1$ , the method is called the **Crout's** method.

If we take  $u_{ij} = 1, i = 1 \dots n$ , the system of equations (1) can be written as

$$l_{ij} = a_{ij} - \sum_{k=1}^{j-1} l_{ik} u_{kj}, \quad i \geq j$$

NPTEL ONLINE CERTIFICATION COURSE
5

So if I take the diagonal entries of lower triangle matrix as 1 the method is known as Doolittle method. If I take the entries of upper triangle matrix as 1, entries means diagonal entries, the method is called as Crout's method. Now let us take the entries of upper triangle matrix the entries those are a diagonal, when diagonal is 1 then total 6 unknowns from here, 3 unknowns from here and 9 entries then what I will do? I will find out the values of all  $l_{ij}$  and  $u_{ij}$ .

(Refer Slide Time: 8:22)

### LU decomposition

#### Doolittle and Crout's Schemes

When we choose

- $l_{ii} = 1$ , the method is known as **Doolittle's** method.
- $u_{ij} = 1$ , the method is called the **Crout's** method.

If we take  $u_{ii} = 1, i = 1 \dots n$ , the system of equations (1) can be written as

$$l_{ij} = a_{ij} - \sum_{k=1}^{j-1} l_{ik} u_{kj}, \quad i \geq j$$

IT ROORKEE NPTEL ONLINE CERTIFICATION COURSE 5

### LU decomposition

#### Crout's method

$$u_{ij} = (a_{ij} - \sum_{k=1}^{i-1} l_{ik} u_{kj}) / l_{ii}, \quad i < j \quad (2)$$

$$u_{ii} = 1.$$

- The first column of matrix **L** is identical with first column of matrix **A**. i.e.

$$l_{i1} = a_{i1}, \quad i = 1, \dots, n. \quad (3)$$

$$\text{Also, } u_{1j} = a_{1j} / l_{11}, \quad j = 2, \dots, n. \quad (4)$$

IT ROORKEE NPTEL ONLINE CERTIFICATION COURSE 6

So if we take  $u_{ii}$  equals to 1 from equals to 1 to  $n$  means all diagnosed entries of upper triangle matrix as 1, the system of equation one can be written as  $l_{ij}$  equals to  $a_{ij}$  minus summation  $k$  equals to 1 to  $j$  minus 1  $l_{ik} u_{kj}$ , whenever  $i$  is greater than equals to  $j$ . This can be written in this way whenever  $i$  is less than say by the equation 2, if and all rest of the  $u_{ii}$  equals to 1. When  $i$  is less then  $j$   $u_{ij}$  is given by this equation when  $i$  is equal to or greater than  $j$   $l_{ij}$  is given by this equation, so this equation will give all the entries of lower triangle matrix.

This equation will give you all the entries of upper triangular matrix those are above the main diagonal and the entries of the upper triangular matrix with basically the diagonal entries are 1. Then what we will do? From the 1<sup>st</sup> column of the matrix **L**, we can find out the entries like

$l_{11}, l_{21}, l_{31}$  and  $l_{n1}$  because the 1<sup>st</sup> column of the lower triangular matrix will be identical to the matrix  $A$ . After doing this after finding  $l_{i1}$  for  $i$  equals to 1 to  $n$ , what we will do? We will go to 1<sup>st</sup> row, in 1<sup>st</sup> row we can calculate all  $u_{1j}$  that will be basically a  $l_{1j}$  upon  $l_{11}$  where  $j$  equals to 2 to  $n$ . Here we are taking  $j$  from 2 because  $u_{11}$  is already we have fixed as 1.

(Refer Slide Time: 10:11)

**LU decomposition**

**Crout's method**

- The first column of  $L$  and first row of  $U$  have been determined.
- Now, we proceed to find second column of  $L$  and second row of  $U$ .

$$l_{i2} = a_{i2} - l_{i1}u_{12}, \quad i = 2, \dots, n$$

$$u_{2j} = (a_{2j} - l_{21}u_{1j})/l_{22}, \quad j = 3, \dots, n. \quad (5)$$

IT ROORKEE NPTEL ONLINE CERTIFICATION COURSE 7

**LU decomposition**

**Crout's Method**

- Next, we will find the third column of  $L$  and third row of  $U$ .
- Elements of  $A$  are to be find out by comparing with elements of matrix  $LU$ .
- For relevant indices  $i$  and  $j$ , the elements are computed in order

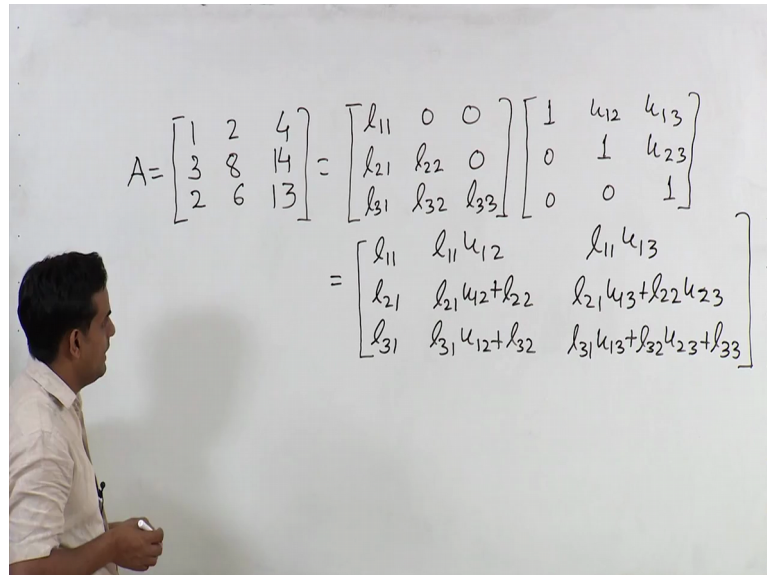

$$l_{i1}, u_{1j}; l_{i2}, u_{2j}; l_{i3}, u_{3j}; \dots; l_{i,n-1}, u_{n-1,j}; l_{nn}$$

IT ROORKEE NPTEL ONLINE CERTIFICATION COURSE 8

So 1<sup>st</sup> column will give you the entries like  $l_{11}, l_{21}, l_{31}$  and so on the 1<sup>st</sup> row will give you the entries like  $u_{11}$  is 1,  $u_{12}, u_{13}$  up to  $u_{1n}$  and then what we will do? Then we will go to 2<sup>nd</sup> column, in 2<sup>nd</sup> column will give me the entry like  $l_{i2}$  equals to  $a_{i2}$  minus  $l_{i1}u_{12}$ ,  $i$  equals to 2 to  $n$  and then 2<sup>nd</sup> row will give the entries of 2<sup>nd</sup> row of  $u$  by the equation 5 and

then we will go like 3<sup>rd</sup> column 3<sup>rd</sup> row, 4<sup>th</sup> column 4<sup>th</sup> row and so on and we will be able to get all these entries  $l_{ij}$  and  $u_{ij}$ .

(Refer Slide Time: 11:09)

$$A = \begin{bmatrix} 1 & 2 & 4 \\ 3 & 8 & 14 \\ 2 & 6 & 13 \end{bmatrix} = \begin{bmatrix} l_{11} & 0 & 0 \\ l_{21} & l_{22} & 0 \\ l_{31} & l_{32} & l_{33} \end{bmatrix} \begin{bmatrix} 1 & u_{12} & u_{13} \\ 0 & 1 & u_{23} \\ 0 & 0 & 1 \end{bmatrix}$$

$$= \begin{bmatrix} l_{11} & l_{11}u_{12} & l_{11}u_{13} \\ l_{21} & l_{21}u_{12} + l_{22} & l_{21}u_{13} + l_{22}u_{23} \\ l_{31} & l_{31}u_{12} + l_{32} & l_{31}u_{13} + l_{32}u_{23} + l_{33} \end{bmatrix}$$

So here we will take an example of this method okay so take a 3 by 3 matrix say which is given as 1, 2, 4 and then the 2<sup>nd</sup> row of this matrix is 3, 8, 14 in the last row of this matrix is 2, 6, 13. Now in Crout's method when we are decomposing this as a lower triangular matrix and upper triangular matrix  $A$  equals to  $l_{11}$ , 0, 0,  $l_{21}$ ,  $l_{22}$ , 0 and then  $l_{31}$ ,  $l_{32}$ ,  $l_{33}$ , so this is a lower triangular matrix  $l$  into an upper triangular matrix  $u$ , so here am taking a main diagonal elements of  $u$  as 1, so 1,  $u_{12}$ ,  $u_{13}$ , 0, 1,  $u_{23}$ , 0, 0, 1. Now if I multiply these two matrices then the 1<sup>st</sup> element will be  $l_{11}$  in the 2<sup>nd</sup> element will be  $l_{11}u_{12}$  and the 3<sup>rd</sup> element will be  $l_{11}u_{13}$ .

Similarly from the 2<sup>nd</sup> row if I multiply with 1<sup>st</sup> column this element will be  $l_{21}$ , this element will be  $l_{21}u_{12}$  plus  $l_{22}$  and this entry will be  $l_{21}u_{13}$  plus  $l_{22}u_{23}$ . In the last row of the product matrix this element will be  $l_{31}$ , this element will become  $l_{31}u_{12}$  plus  $l_{32}$  and finally the last entry of this matrix will be  $l_{31}u_{13}$  plus  $l_{32}u_{23}$  plus  $l_{33}$ . So this matrix equals to  $A$  now comparing these 2 matrices and the comparison will be done based on the strategy I have earlier explained and initially we will compare the elements of 1<sup>st</sup> column.

(Refer Slide Time: 14:20)

$$A = \begin{bmatrix} 1 & 2 & 4 \\ 3 & 8 & 14 \\ 2 & 6 & 13 \end{bmatrix} = \begin{bmatrix} l_{11} & 0 & 0 \\ l_{21} & l_{22} & 0 \\ l_{31} & l_{32} & l_{33} \end{bmatrix} \begin{bmatrix} 1 & u_{12} & u_{13} \\ 0 & 1 & u_{23} \\ 0 & 0 & 1 \end{bmatrix}$$

$$l_{11}=1; l_{21}=3; l_{31}=2$$

$$= \begin{bmatrix} l_{11} & l_{11}u_{12} & l_{11}u_{13} \\ l_{21} & l_{21}u_{12}+l_{22} & l_{21}u_{13}+l_{22}u_{23} \\ l_{31} & l_{31}u_{12}+l_{32} & l_{31}u_{13}+l_{32}u_{23}+l_{33} \end{bmatrix}$$

$$l_{11}u_{12}=2$$

So when I compare the elements 1<sup>st</sup> column of this matrix with this one I will get l<sub>11</sub> equals to 1, l<sub>21</sub> equals to 3 and finally l<sub>31</sub> equals to 2. So after comparing the elements of 1<sup>st</sup> column now will compare the elements of 1<sup>st</sup> row, so I will take this element and this element is l<sub>11</sub> into u<sub>12</sub> and in this matrix this is 2 since l<sub>11</sub> is 1, so u<sub>12</sub> comes out to be 2, so here u<sub>12</sub> is 2. Now I will take this element, so when I will compare this element with this one l<sub>11</sub> is already one so I will get u<sub>13</sub> as 4. Now I will compare the elements of 2<sup>nd</sup> column, so for this I will take this particular element, so l<sub>21</sub> u<sub>12</sub> plus l<sub>22</sub> equals to 8 and l<sub>21</sub>, l<sub>21</sub> is 3 into u<sub>12</sub> is 2 plus l<sub>22</sub> is 8.

(Refer Slide Time: 16:02)

$$A = \begin{bmatrix} 1 & 2 & 4 \\ 3 & 8 & 14 \\ 2 & 6 & 13 \end{bmatrix} = \begin{bmatrix} l_{11} & 0 & 0 \\ l_{21} & l_{22} & 0 \\ l_{31} & l_{32} & l_{33} \end{bmatrix} \begin{bmatrix} 1 & u_{12} & u_{13} \\ 0 & 1 & u_{23} \\ 0 & 0 & 1 \end{bmatrix}$$

$$l_{11}=1; l_{21}=3; l_{31}=2$$

$$u_{12}=2; u_{13}=4$$

$$l_{22}=2; l_{32}=2$$

$$= \begin{bmatrix} l_{11} & l_{11}u_{12} & l_{11}u_{13} \\ l_{21} & l_{21}u_{12}+l_{22} & l_{21}u_{13}+l_{22}u_{23} \\ l_{31} & l_{31}u_{12}+l_{32} & l_{31}u_{13}+l_{32}u_{23}+l_{33} \end{bmatrix}$$

$$l_{31}u_{12}+l_{32}=6$$

$$2 \times 2 + l_{32}=6$$

$$A = \begin{bmatrix} 1 & 2 & 4 \\ 3 & 8 & 14 \\ 2 & 6 & 13 \end{bmatrix} = \begin{bmatrix} l_{11} & 0 & 0 \\ l_{21} & l_{22} & 0 \\ l_{31} & l_{32} & l_{33} \end{bmatrix} \begin{bmatrix} 1 & u_{12} & u_{13} \\ 0 & 1 & u_{23} \\ 0 & 0 & 1 \end{bmatrix}$$

$l_{11} = 1; l_{21} = 3; l_{31} = 2$   
 $u_{12} = 2; u_{13} = 4$   
 $l_{22} = 2; l_{32} = 2$

$$= \begin{bmatrix} l_{11} & l_{11}u_{12} & l_{11}u_{13} \\ l_{21} & l_{21}u_{12} + l_{22} & l_{21}u_{13} + l_{22}u_{23} \\ l_{31} & l_{31}u_{12} + l_{32} & l_{31}u_{13} + l_{32}u_{23} + l_{33} \end{bmatrix}$$

$l_{31}u_{12} + l_{32} = 6$   
 $2 \times 2 + l_{32} = 6$

So from here I got  $l_{22}$  equals to 8 minus 6 that is 2. Now I will take this element, so this gives me  $l_{31}u_{12}$  plus  $l_{32}$  and from here it is 6,  $l_{31}$  is 2  $u_{12}$  is 2 plus  $l_{32}$  equals to 6 and from here I got  $l_{32}$  equals to 2. So out of the 9 elements I got 7 elements just by comparing 2 columns and one row.

(Refer Slide Time: 16:52)

$$A = \begin{bmatrix} 1 & 2 & 4 \\ 3 & 8 & 14 \\ 2 & 6 & 13 \end{bmatrix} = \begin{bmatrix} l_{11} & 0 & 0 \\ l_{21} & l_{22} & 0 \\ l_{31} & l_{32} & l_{33} \end{bmatrix} \begin{bmatrix} 1 & u_{12} & u_{13} \\ 0 & 1 & u_{23} \\ 0 & 0 & 1 \end{bmatrix}$$

$l_{11} = 1; l_{21} = 3; l_{31} = 2$   
 $u_{12} = 2; u_{13} = 4$   
 $l_{22} = 2; l_{32} = 2$   
 $u_{23} = 1$

$$= \begin{bmatrix} l_{11} & l_{11}u_{12} & l_{11}u_{13} \\ l_{21} & l_{21}u_{12} + l_{22} & l_{21}u_{13} + l_{22}u_{23} \\ l_{31} & l_{31}u_{12} + l_{32} & l_{31}u_{13} + l_{32}u_{23} + l_{33} \end{bmatrix}$$

$l_{21}u_{13} + l_{22}u_{23} = 14$   
 $3 \times 4 + 2u_{23} = 14$

$$A = \begin{bmatrix} 1 & 2 & 4 \\ 3 & 8 & 14 \\ 2 & 6 & 13 \end{bmatrix} = \begin{bmatrix} l_{11} & 0 & 0 \\ l_{21} & l_{22} & 0 \\ l_{31} & l_{32} & l_{33} \end{bmatrix} \begin{bmatrix} 1 & u_{12} & u_{13} \\ 0 & 1 & u_{23} \\ 0 & 0 & 1 \end{bmatrix}$$

$l_{11}=1; l_{21}=3; l_{31}=2$   
 $u_{12}=2; u_{13}=4$   
 $l_{22}=2; l_{32}=2$   
 $u_{23}=1$   
 $l_{33}=3$

$$= \begin{bmatrix} l_{11} & l_{11}u_{12} & l_{11}u_{13} \\ l_{21} & l_{21}u_{12}+l_{22} & l_{21}u_{13}+l_{22}u_{23} \\ l_{31} & l_{31}u_{12}+l_{32} & l_{31}u_{13}+l_{32}u_{23}+l_{33} \end{bmatrix}$$

$2 \times 4 + 2 \times 1 + l_{33} = 13$   
 $l_{33} = 3$

Now I will compare 2<sup>nd</sup> row so from 2<sup>nd</sup> row this element is already I have taken in comparison this one have taken so now I will go for this element. So when I will compare this element it is  $l_{21}$  into  $u_{13}$  plus  $l_{22}$   $u_{23}$  and from here it is 14 so  $l_{21}$  is 3  $u_{13}$  is 4 plus  $l_{22}$  is 2  $u_{23}$  equals to 14. So from here I will get  $u_{23}$  equals to 2, so  $u_{23}$  equals to 1 and finally I will compare this element, so this element is  $l_{31}$ , so  $l_{31}$  is already known to us it is 2 in to  $u_{13}$  which is 4 plus  $l_{32}$ ,  $l_{32}$  is 2 into  $u_{23}$  which is 1 plus  $l_{33}$  equals to 13, so 8 plus 2 10 so from your I got  $l_{33}$  as 13 minus 10 that is 3.

(Refer Slide Time: 18:45)

$$A = \begin{bmatrix} 1 & 2 & 4 \\ 3 & 8 & 14 \\ 2 & 6 & 13 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 \\ 3 & 2 & 0 \\ 2 & 2 & 3 \end{bmatrix} \begin{bmatrix} 1 & 2 & 4 \\ 0 & 1 & 1 \\ 0 & 0 & 1 \end{bmatrix}$$

$l_{11}=1; l_{21}=3; l_{31}=2$   
 $u_{12}=2; u_{13}=4$   
 $l_{22}=2; l_{32}=2$   
 $u_{23}=1$   
 $l_{33}=3$

So in this way I calculated all the 9 entries, so now if I write these 9 entries the decomposition or LU decomposition of this matrix will be 1, 3, 2 then  $l_{22}$  is 2,  $l_{32}$  is 2,  $l_{33}$  is 3, so this is the lower triangular matrix and the upper triangular matrix is  $u_{12}$  is 2,  $u_{13}$  is 4

and finally  $u_{23}$  is 1. So hence this is an example of LU decomposition of a given matrix A when the diagonal entries of the upper triangular matrix are 1.

(Refer Slide Time: 19:50)

LU decomposition

Example: Doolittle's method

Consider the matrix

$$A = \begin{pmatrix} 1 & 2 & 4 \\ 3 & 8 & 14 \\ 2 & 6 & 13 \end{pmatrix} = \begin{pmatrix} 1 & 0 & 0 \\ l_{21} & 1 & 0 \\ l_{31} & l_{32} & 1 \end{pmatrix} \begin{pmatrix} u_{11} & u_{12} & u_{13} \\ 0 & u_{22} & u_{23} \\ 0 & 0 & u_{33} \end{pmatrix}$$

$$= \begin{pmatrix} u_{11} & u_{12} & u_{13} \\ l_{21}u_{11} & l_{21}u_{12} + u_{22} & l_{21}u_{13} + u_{23} \\ l_{31}u_{11} & l_{31}u_{12} + l_{32}u_{22} & l_{31}u_{13} + l_{32}u_{23} + u_{33} \end{pmatrix}$$

1T Roorkee NPTEL ONLINE CERTIFICATION COURSE 12

LU decomposition

First row gives

$$u_{11} = 1; \quad u_{12} = 2; \quad u_{13} = 4$$

First column gives

$$l_{21} = 3; \quad l_{31} = 2$$

Similarly making other rows and columns comparisons, we get

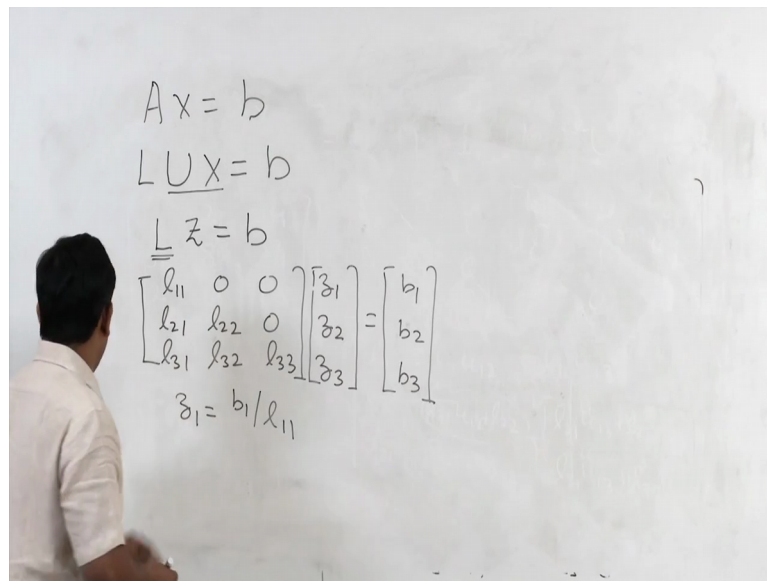

$$A = \begin{pmatrix} 1 & 2 & 4 \\ 3 & 8 & 14 \\ 2 & 6 & 13 \end{pmatrix} = \begin{pmatrix} 1 & 0 & 0 \\ 3 & 1 & 0 \\ 2 & 1 & 1 \end{pmatrix} \begin{pmatrix} 1 & 2 & 4 \\ 0 & 2 & 2 \\ 0 & 0 & 3 \end{pmatrix}$$

1T Roorkee NPTEL ONLINE CERTIFICATION COURSE 13

So this is the example of Doolittle method so as you can see  $u_{11}$  will be 1  $u_{12}$  will be 2  $u_{13}$  will be 4, so this is coming from the 1<sup>st</sup> row similarly 1<sup>st</sup> column gives me  $l_{21}$  equals to 3 and  $l_{31}$  equals to 2 similarly making the other comparisons I will be able to decompose the matrix say which is the same matrix as I have taken in Crout's method equals to product of these 2 matrices.

(Refer Slide Time: 20:39)

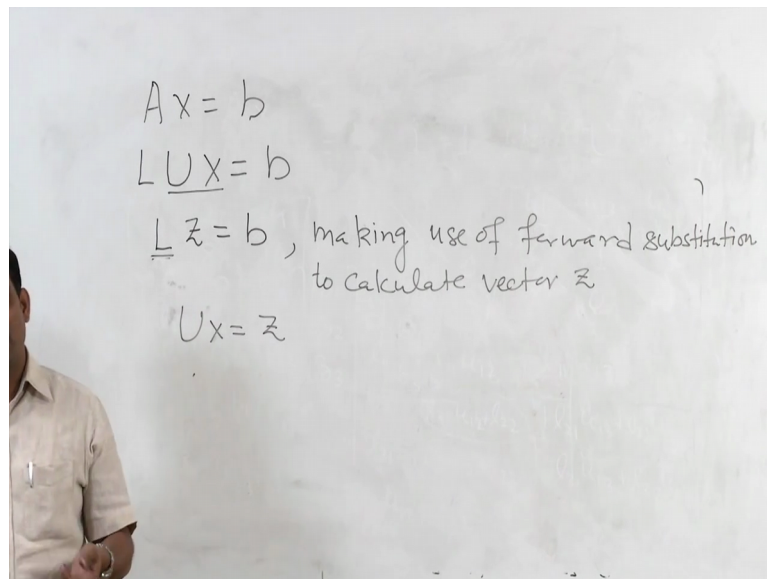

The whiteboard contains the following handwritten text:

$$Ax = b$$
$$LUX = b$$
$$\underline{L}z = b$$
$$\begin{bmatrix} l_{11} & 0 & 0 \\ l_{21} & l_{22} & 0 \\ l_{31} & l_{32} & l_{33} \end{bmatrix} \begin{bmatrix} z_1 \\ z_2 \\ z_3 \end{bmatrix} = \begin{bmatrix} b_1 \\ b_2 \\ b_3 \end{bmatrix}$$
$$z_1 = b_1 / l_{11}$$

Now this is about the factorisation or decomposition, now question how to solve a linear system using the concept of factorisation, So let me explain it so basically we are having  $Ax$  equals to  $b$ , so I have decomposed  $A$  as  $L$  into  $U$  so  $LU$  into  $x$  equals to  $b$ . Now what I will do let us assume that this  $Ux$  equals to  $z$ , so what I will be having  $Ux$  will be a column vector so let us say it is  $z_1, z_2, z_n$ , so  $Ux$  equals to  $z$  and if I substitute  $Ux$  equal to  $z$ , the original system will become  $Lz$  equals to  $b$ .

Here you can note down that  $L$  is a lower triangular matrix, so what I will do it will be something like that  $l_{11}, 0, 0, l_{21}, l_{22}, 0, l_{31}, l_{32}, l_{33}$  into  $z_1, z_2, z_3$  this equals to  $b_1, b_2, b_3$ , so what I can do it is a lower triangular matrix so from the 1<sup>st</sup> equation it gives  $z_1$  equals to  $b_1$  upon  $l_{11}$  directly. Now what I will do in the 2<sup>nd</sup> equation I will substitute the value of  $z_1$  and I will get the value of  $z_2$  similarly from the 3<sup>rd</sup> equation I will substitute the value of  $z_1$  and  $z_2$  and I will get the value of  $z_3$ , so this is something I am doing like forward substitution, so making use of forward substitution I am getting the values of  $z_1, z_2, z_3$ , so once  $z_1, z_2, z_3$  or up to  $z_n$  if we are having  $n$  dimensional matrix  $n$  by  $n$  matrix then I can find out the unknown factor  $z$ .

(Refer Slide Time: 23:13)

A person is standing next to a whiteboard. The whiteboard has the following handwritten text:

$$Ax = b$$
$$LUX = b$$
$$\underline{L} \underline{z} = b, \text{ making use of forward substitution to calculate vector } z$$
$$Ux = z$$

So here what I am doing I am making use of forward substitution and I have to calculate vector  $z$ . Once I know these vector  $z$  I know that  $Ux$  equals to  $z$ ,  $U$  is an upper triangular matrix  $z$  is known to me by this step I can find out the value of  $x$  by making use of back substitution as we have done in Gaussian elimination, so from the last equation I can get the value of  $x_n$  I will substitute the value of  $x_n$  in penultimate equation from there I will get the value of  $x_{n-1}$  and so on. Finally substituting the value of  $x_n$ ,  $x_{n-1}$  up to  $x_2$  from the 1<sup>st</sup> equation I will get the value of  $x_1$  and this method is called Crout's method for solving the linear system of equation, so you are what we are doing 1<sup>st</sup> we are decomposing our coefficient matrix as the product of lower triangular and upper triangular matrix and then we are using forward substitution and finally back substitution.

(Refer Slide Time: 25:02)

## Linear System

### Example

Consider the system of equations

$$\begin{bmatrix} 1 & 2 & 4 \\ 3 & 8 & 14 \\ 2 & 6 & 13 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 4 \\ 12 \\ 11 \end{bmatrix}$$

IIT ROORKEE

NPTEL ONLINE  
CERTIFICATION COURSE

15

## Triangularization Method

### Example

This system can be written as in triangular matrices form

$$\begin{pmatrix} 1 & 0 & 0 \\ 3 & 1 & 0 \\ 2 & 1 & 1 \end{pmatrix} \begin{pmatrix} 1 & 2 & 4 \\ 0 & 2 & 2 \\ 0 & 0 & 3 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} 4 \\ 12 \\ 11 \end{pmatrix}$$

Let

$$\begin{pmatrix} 1 & 2 & 4 \\ 0 & 2 & 2 \\ 0 & 0 & 3 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} z_1 \\ z_2 \\ z_3 \end{pmatrix}$$

16

## Triangularization Method

### Example cont...

$$\begin{pmatrix} 1 & 0 & 0 \\ 3 & 1 & 0 \\ 2 & 1 & 1 \end{pmatrix} \begin{pmatrix} z_1 \\ z_2 \\ z_3 \end{pmatrix} = \begin{pmatrix} 4 \\ 12 \\ 11 \end{pmatrix}$$

Using forward substitution, we get  $z_1 = 4$ ;  $z_2 = 0$ ;  $z_3 = 3$ . Now, solving  $Lx = z$  using back substitution

$$\begin{pmatrix} 1 & 2 & 4 \\ 0 & 2 & 2 \\ 0 & 0 & 3 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} 4 \\ 0 \\ 3 \end{pmatrix}$$

We get  $x_1 = 2$ ;  $x_2 = -1$ ;  $x_3 = 1$ .

NPTEL ONLINE  
CERTIFICATION COURSE

17

This is the example which I have taken earlier, so suppose we are having this system of equation 1, 2, 4, 3, 8, 14, 2, 6, 13, so 3 equations with 3 unknowns the matrix the coefficient matrix is same which have taken earlier, so I can write this as a product of L into U x equals to b. Now assume this equals to z 1, z 2, z 3. So what will happen if I substitute this by z 1, z 2, z 3 the original system can be written like this. From here using the forward substitution I can get z 1 equals to 4 z 2 equals to 0 and z 3 equals to 3.

(Refer Slide Time: 25:46)

### Triangularization Method

**Example**

This system can be written as in triangular matrices form

$$\begin{pmatrix} 1 & 0 & 0 \\ 3 & 1 & 0 \\ 2 & 1 & 1 \end{pmatrix} \begin{pmatrix} 1 & 2 & 4 \\ 0 & 2 & 2 \\ 0 & 0 & 3 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} 4 \\ 12 \\ 11 \end{pmatrix}$$

Let

$$\begin{pmatrix} 1 & 2 & 4 \\ 0 & 2 & 2 \\ 0 & 0 & 3 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} z_1 \\ z_2 \\ z_3 \end{pmatrix}$$

## LU Decomposition

### Inverse of a matrix

Also,  $L^{-1}$  and  $U^{-1}$  are calculated to get

$$z = L^{-1}b \text{ and } x = U^{-1}z \quad (9)$$

Thus, inverse of  $A$  can also be determined from

$$A^{-1} = U^{-1}L^{-1}. \quad (10)$$

- This method fails if any of diagonal elements  $l_{ii}$  or  $u_{ii}$  is zero.
- So, LU decomposition is guaranteed if matrix  $A$  is positive definite.

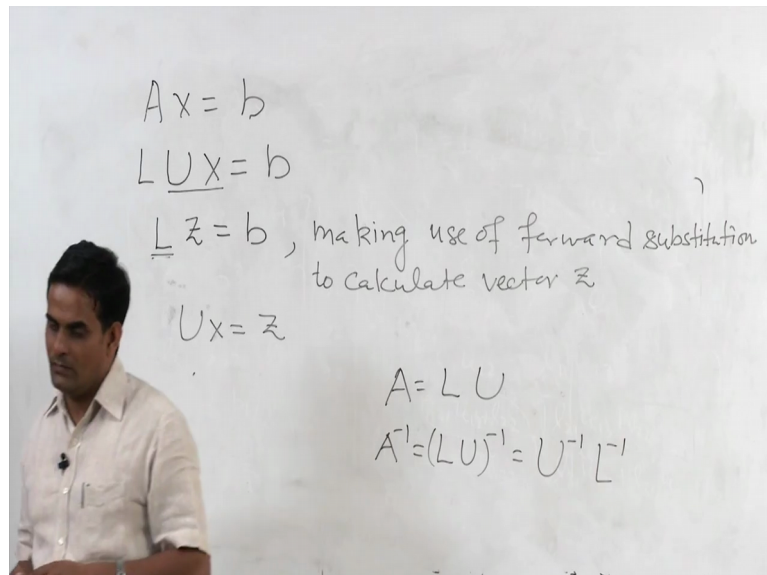

IIT ROORKEE

NPTEL ONLINE  
CERTIFICATION COURSE

18

What I will do now I will put the value of  $z_1, z_2, z_3$  here and I will get the values of  $x_1, x_2, x_3$  which is coming out like  $x_1$  equals to 2,  $x_2$  equals to minus 1 and  $x_3$  equals to 1 which is the solution of the system. We can also find out the inverse using the LU decomposition, so for finding the inverse you know that we can write  $A$  equals to  $L$  into  $U$ , so  $A$  inverse will become  $LU$  inverse that is basically  $U$  inverse into  $L$  inverse. Now question is whether this method will always work? No.

This method fails if any of the diagonal elements either from the lower triangular matrix or from the upper triangle matrix, in the 2 method is 0 because what will happen for calculating the values of other variables the diagonal elements used to come in denominator and if it is 0 we cannot find a finite value or the other variable. So what is the condition, sufficient

condition for this method? LU decomposition is guaranteed to give you a solution if the matrix  $A$  is a positive definite matrix.

(Refer Slide Time: 27:29)

The slide is titled "LU Decomposition" in a blue header. Below the header, there are two main sections. The first section, "Positive Definite Matrix", defines a symmetric  $n \times n$  matrix  $A$  as positive definite if for all nonzero vectors  $x$ , the product  $x^T A x > 0$ . The second section, "Remarks", contains three bullet points: 1) A positive definite matrix  $M$  is invertible. 2) All the eigenvalues with corresponding real eigenvectors of a positive definite matrix are positive. 3) A symmetric matrix is positive definite if: (i) all the diagonal entries are positive, and (ii) each diagonal entry is greater than the sum of the absolute values of all other entries in the corresponding row/column. At the bottom of the slide, there are logos for "IIT ROORKEE" and "NPTEL ONLINE CERTIFICATION COURSE", and the page number "19" is in the bottom right corner.

**LU Decomposition**

**Positive Definite Matrix**  
A symmetric  $n \times n$  matrix  $A$  is said to be positive definite if for all nonzero vectors  $x$ , the product  $x^T A x > 0$ .

**Remarks**

- A positive definite matrix  $M$  is invertible.
- All the eigenvalues with corresponding real eigenvectors of a positive definite matrix are positive.
- A symmetric matrix is positive definite if: (i) all the diagonal entries are positive, and (ii) each diagonal entry is greater than the sum of the absolute values of all other entries in the corresponding row/column.

IIT ROORKEE NPTEL ONLINE CERTIFICATION COURSE 19

Now what we mean by a positive definite matrix? A symmetric  $n$  by  $n$  matrix  $A$  is said to be positive definite if you take a nonzero vector  $x$ , the product of  $x$  transpose  $A$  into  $x$  comes out positive. There are some other property of the positive definite matrix like a positive definite matrix will be always invertible means determinate will be positive or nonzero. All the eigenvalues with corresponding real eigenvector of a positive definite matrix will be positive. A symmetric matrix is positive definite if all the diagonal entries are positive and each diagonal entry is greater than the sum of the absolute value of all other entries in the corresponding row and columns.

There is one more method for the symmetric matrix if the coefficient matrix is a symmetric matrix that is called Cholesky method is basically since the coefficient matrix is the symmetric we can write it as the product of  $L$  into  $L$  transpose, so if  $L$  is the lower triangular matrix  $L$  transpose will become an upper triangular matrix, so in other way we can write as the product of an upper triangular matrix  $U$  into  $U$  transposes. Hence in decomposition we need to find out only one matrix instead of  $L$  and  $U$  either  $L$  or  $U$  and then the rest of the process will be similar to the Crout's or Doolittle method.

(Refer Slide Time: 29:24)

## Linear system

### Cholesky Method

(13) can be written as

$$\mathbf{L}^T \mathbf{x} = \mathbf{z} \quad (14)$$

$$\mathbf{L} \mathbf{z} = \mathbf{b} \quad (15)$$

- The values  $z_i$ ,  $i = 1, \dots, n$  are obtained from (15) by forward substitution.
- $x_i$ ,  $i = 1, \dots, n$  are determined from (14) by back substitution.
- Alternatively, we can also find  $\mathbf{L}^{-1}$  and obtain

$$\mathbf{z} = \mathbf{L}^{-1} \mathbf{b} \quad (16)$$

and,

$$\mathbf{x} = (\mathbf{L}^T)^{-1} \mathbf{z} = (\mathbf{L}^{-1})^T \mathbf{z}$$

NPTEL ONLINE  
CERTIFICATION COURSE

21

## Linear system

### Cholesky Method

• The inverse of  $\mathbf{A}$  can be obtained from (11)

$$\mathbf{A}^{-1} = (\mathbf{L}^{-1})^T \mathbf{L}^{-1} \quad (17)$$

The elements of lower triangular matrix  $\mathbf{L}$  may be obtained as

$$l_{ij} = \left( a_{ij} - \sum_{j=1}^{i-1} l_{ij}^2 \right)^{1/2}, \quad i = 1, 2, \dots, n$$

NPTEL ONLINE  
CERTIFICATION COURSE

22

## Linear system

### Cholesky Method

$$u_{ij} = \left( a_{ij} - \sum_{k=j+1}^n u_{ik} u_{jk} \right) / u_{jj},$$

$$i = n-2, n-3, \dots, 1; \quad j = i+1, i+2, \dots, n-1$$

$$u_{ii} = \left( a_{ii} - \sum_{k=i+1}^n u_{ik}^2 \right)^{1/2}, \quad i = n-1, n-2, \dots, 1$$

$$u_{ij} = 0, \quad i > j \quad (19)$$

## Cholesky Method

### Example

Consider the system of equations

$$\begin{bmatrix} 4 & -1 & 0 & 0 \\ -1 & 4 & -1 & 0 \\ 0 & -1 & 4 & -1 \\ 0 & 0 & -1 & 4 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \end{bmatrix}$$

We will solve the above system using Cholesky method and determine  $A^{-1}$ .

IIT ROORKEE

NPTEL ONLINE  
CERTIFICATION COURSE

25

Like if you are writing  $A$  equals to  $L$  into  $L$  transport the system of equation say  $x$  equals to  $b$  can be written as  $L$  into  $L$  transport as  $x$  equals to  $b$ , just as you  $L$  transport as  $x$  equals to  $z$ , so this will give  $Lz$  equals to  $b$ , so from here you will calculate  $z$  and then you can substitute back the value of  $z$  here to find out  $x$ , if  $L$  is non-singular you can calculate  $z$  as  $L$  inverse  $b$  and then finally  $x$  as  $L$  transport inverse  $z$  that is  $L$  inverse transport  $z$  similarly you can use Cholesky method to find out the inverse of  $A$  matrix, so inverse is given by  $L$  inverse transport into  $L$  inverse, so this is the working process equations to find out the entries in the Cholesky method. It will be the same as we have did in Crout's method and only change will be due to the symmetric property of  $A$ . Consider this example it is a 4 by 4 system the coefficient matrix is a tri-diagonal matrix it is a symmetric matrix.

(Refer Slide Time: 30:31)

## Cholesky Method

### Example

Suppose

$$L = \begin{bmatrix} l_{11} & 0 & 0 & 0 \\ l_{21} & l_{22} & 0 & 0 \\ l_{31} & l_{32} & l_{33} & 0 \\ l_{41} & l_{42} & l_{43} & l_{44} \end{bmatrix}$$

$$A = LL^T = \begin{bmatrix} l_{11} & 0 & 0 & 0 \\ l_{21} & l_{22} & 0 & 0 \\ l_{31} & l_{32} & l_{33} & 0 \\ l_{41} & l_{42} & l_{43} & l_{44} \end{bmatrix} \begin{bmatrix} l_{11} & l_{21} & l_{31} & l_{41} \\ 0 & l_{22} & l_{32} & l_{42} \\ 0 & 0 & l_{33} & l_{43} \\ 0 & 0 & 0 & l_{44} \end{bmatrix}$$

IIT ROORKEE

NPTEL ONLINE

If I want to find L inverse the same process L inverse comes out in this way which is equal to this particular matrix and A inverse will become L inverse transport into L inverse that this is the matrix A inverse. So in this lecture I discussed about method based on triangular matrices for solving the linear system of equation. Here first I discussed about the Crout's method and Doolittle method and finally I have given a small explanation to Cholesky decomposition which is basically in the case when A is a symmetric matrix. In the next lecture I will go to other category for solving the linear system of equation and that category is called Iterative methods. So far I have discussed direct methods and Iterative methods are basically having few advantages over the direct methods, so thank you very much for listening this lecture.
