Lecture – 05
Vector Space- II

Hello, friends. Welcome to my lecture on Vector Space 2. This is second lecture on vector spaces. We will begin with the linear span of a set in a vector space.

(Refer Slide Time: 00:35)

So, let V be a vector space and S be a subset of V , then we define a linear span last time. Linear span of S which we denote by $L(S)$. Linear span of S is the set of all linear combinations of vectors of S . So, this I can write as set of all u belonging to V such that u is equal to $\sum_{i=1}^n \alpha_i v_i$, i is equal to 1 to n where α_i is belong to the field F and v_i is belong to S for all i equal to 1 to n . V is a vector space over the field F . F is equal to \mathbb{R} when we take real vector spaces and F is equal to \mathbb{C} when we deal with complex vector spaces.

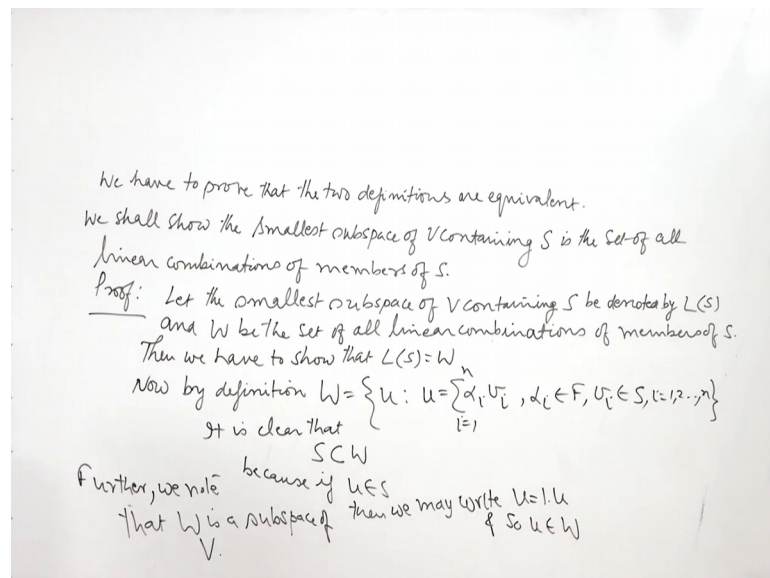

So, there is another definition of linear span which we call as implicit definition. As I said in my last lecture the intersection of any number of subspaces of a vector space is again a vector space. The intersection of any number of subspaces of a vector space is a subspace if I take vector space as V then it is a subspace of V . So, it is very simple to prove you can say suppose let W_α where α belongs to Λ ; Λ being an

index set be an arbitrary collection of subspaces of V , then intersection W_α belongs to λ is also a subspace of V . So, this can be easily proved.

So, making use of these result, let us consider all those subspaces of V which contain S . There is one subspace of V already there which is the vector space V itself which contains S . So, let us consider. So, what we are going to do is, we are going to show that the linear span of S whose implicit definition is the intersection of all subspaces of V which contain S and intersection one be considered intersection all subspaces of V which contain S then by this result it will be a subspace of V and moreover, this subspace of V will contain S and it will be contained in every subspace of V which contains S . So, it is called as the smallest subspace of V containing S .

So, we can prove that, $L(S)$ implicit definition. The implicit definition says that the linear span of S , $L(S)$ is the smallest subspace of V containing S . So, this is called as the implicit definition and the definition which we have written here, it is called the explicit definition both the definitions are equivalent. Let us see how we prove that.

(Refer Slide Time: 05:23)

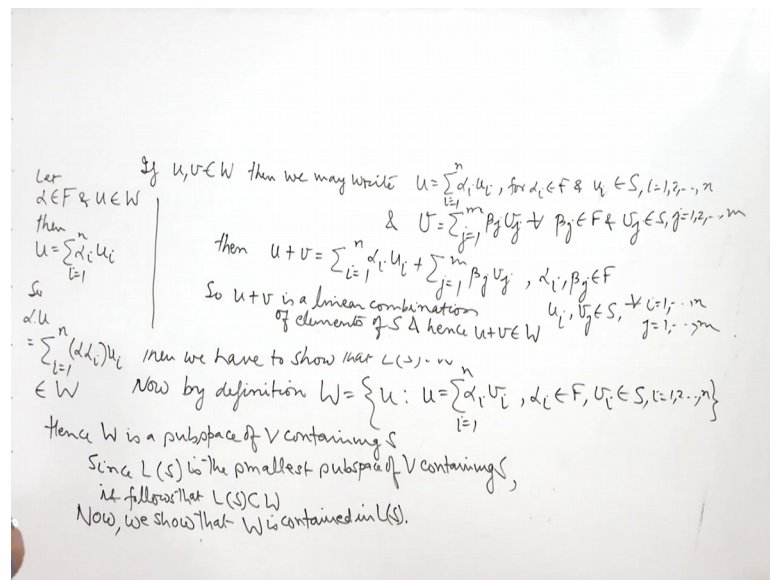

The two definitions are equivalent. So let us say, we have to prove that the implicit two definitions are equivalent. So, in order to show this, let us take up one definition. Let us say let us take up the implicit definition that is let us assume that $L(S)$ is the smallest subspace of V containing S and we show that this $L(S)$ is the setup of all linear

combinations of members of S. So, we shall show that the smallest subspace of V containing S is the set of all linear combinations of members of S. So, let us prove this.

So, let us say, the smallest subspace of V containing S be denoted by L S we take this notation of this implicit definition and W be the set of all linear combinations of members of S or elements of S. Then, we prove that we have to show that L S is equal to W. Now, W by definition it is the set of all elements u belonging W such that u is equal to $\sum_{i=1}^n \alpha_i v_i$, i is equal to 1 to n, α_i belong to F, v_i is belong to S, i is equal to 1 to n and so on up to n.

So, let us first show that L S is contained in W and then we shall show that W is contained in L S. It is clear that S is contained in W. Because, you take any element u belonging to S then I can write u as $1 \cdot u$. So, u can be expressed as a linear combination of members of S and therefore, u belongs to W. So, W is a set which contains S. Now, further we can show that W is a subspace of V, further we note that W is a subspace of V.

(Refer Slide Time: 10:30)

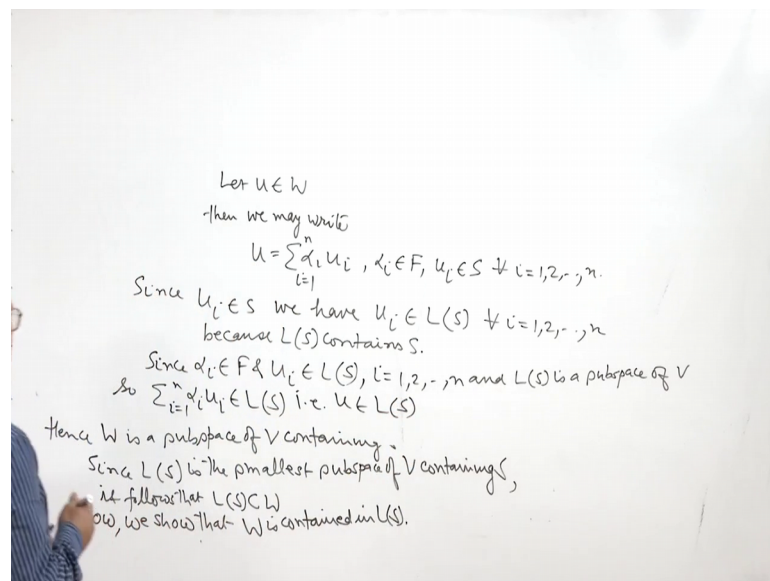

If we take, if u and v belong to W then we can write u as $\sum_{i=1}^n \alpha_i v_i$, i equal to 1 to n for α_i belonging to F and v_i belonging to S, for all i and similarly, I can write v as $\sum_{j=1}^m \beta_j v_j$, let us take $u = \sum_{i=1}^n \alpha_i v_i$ and here we take $v = \sum_{j=1}^m \beta_j v_j$ for all β_j belonging to F and v_j belonging to S.

So, $u + v$ is a linear combination of elements of S and hence $u + v$ belong to W . Now, let us show that, W is closed with respect to vector addition. Now, we have to show that W is closed with respect to a scalar multiplication. So, let us say let α belong to F and u belong to W , then u , I can write as $\sum_{i=1}^n \alpha_i u_i$, i is equal to 1 to n and. So, αu is equal to $\sum_{i=1}^n \alpha \alpha_i u_i$, $\alpha \alpha_i$ is equal to $\alpha \alpha_i$, F is a field. So, when α belongs to F and α_i is belong to F $\alpha \alpha_i$ is belong to F for all i . So, this is an element belonging to W . We have a linear combination of elements of S , u_i belong to S .

Now, so, W is close with respect to it is scalar multiplication and therefore, W is subspace of V containing S . Now, since $L(S)$ is the smallest subspace of V containing S , we have it follows that $L(S)$ must be contained in W it is contained in every subspace of V that contains S . So, $L(S)$ is contained in W . Now, let us prove that W is contained in $L(S)$.

(Refer Slide Time: 16:16)

Now, we show, let us show that W is contained in $L(S)$. So, let us allot u belong to W . We want to show that u belongs to $L(S)$, then by definition of W we may write u as $\sum_{i=1}^n \alpha_i u_i$, α_i is equal to 1 to n where α_i is belong to F , u_i is belong to S for all i . Now, $L(S)$ is a subspace. So, if you take any element if $u_1 + u_2$, u_1 belong to S then $\alpha_1 u_1 + \alpha_2 u_2$ since, u_i is belong to S we have u_i belong to $L(S)$ for every i , because $L(S)$ contains S . Now, u_i is belong to $L(S)$ for every i , i is equal to 1 to n and now if α_i is belong to F and u_i is belong to $L(S)$, I think I should write since α_i is

belong to F and u_i belong to S , i is equal to 1 to n and $L S$ is a subspace of V . So, it is closed with respect to vector addition and scalar multiplication. So, $\sum_{i=1}^n \alpha_i u_i$ belong to $L S$, that is, to say u belong to $L S$, so which means that W is contained in $L S$.

(Refer Slide Time: 19:07)

So, this proves that $L S$ is equal to W . So, the linear span of a set S in a vector space is the set of all linear combinations of elements of S . So, this is what we have. We have characterized the linear span of a set S in a vector space, now let us look at some simple results.

(Refer Slide Time: 19:46).

- **Remark 1:** Let u_1, u_2, \dots, u_m span V then for any vector w , the set w, u_1, u_2, \dots, u_m also spans V .
- **Remark 2:** Suppose u_1, u_2, \dots, u_n span V and u_k is a linear combination of some of other u 's. Then u 's without u_k also span V .
- **Remark 3:** Let u_1, u_2, \dots, u_n span V and suppose one of u 's is zero vector then the u 's without the zero vector span V .

3

Let u_1, u_2, \dots, u_m be a set of m vectors which span S , then you take any vector W in the vector space V . u_1, u_2, \dots, u_m will also span V . So, this let us see we have easily we can prove this.

(Refer Slide Time: 20:06)

$\text{So, } L(S') = V.$

Let $S = \{u_1, u_2, \dots, u_m\}$
 $L(S) = V$
 Let $w \in V$
 Then $L(\{u_1, u_2, \dots, u_m, w\}) = V$
 Since $w \in V$ we have $w = \sum_{i=1}^m \alpha_i u_i$
 Consider any linear combination of the vectors u_1, u_2, \dots, u_m and w
 $u = \sum_{j=1}^m \beta_j u_j + \alpha w \in L(S')$
 where $S' = \{u_1, u_2, \dots, u_m, w\}$

Since $u_1, u_2, \dots, u_m \in S$ they belong to V & $w \in V$
 So $u_1, u_2, \dots, u_m, w \in V$
 & V is a vector space
 hence
 $u \in V$
 So $L(S') \subset V$
 conversely, let
 let $u \in V$ then
 $u = \sum_{j=1}^m \alpha_j u_j$
 $= \sum_{j=1}^m \alpha_j u_j + 0 \cdot w \Rightarrow u \in L(S')$
 $\Rightarrow V \subset L(S')$

So, let us say let S be equal to set of all vectors u_1, u_2, \dots, u_m and that span V . So, $L(S)$ been span of S is equal to V . So, the set of vectors span V . So, $L(S)$ is equal to V now you take any vector W , let W belongs to V ; then we have to show that V the set L of u_1, u_2 and so on u_m , W is also equal to V .

So let us take any vector any say u belonging to V then we have to show that u can be written as a linear combination of u_1, u_2, \dots, u_m and W . From here W belongs to V we can say that W can be written as a linear combination of u_1, u_2, \dots, u_m . So, since W belongs to V we have W equal to $\sum_{i=1}^m \alpha_i u_i$, i is equal to 1 to m . Consider any linear combination of the vectors u_1, u_2, \dots, u_m and W . We can write it as we have $\sum_{j=1}^m \beta_j u_j$; j equal to 1 to m plus some scalar α times W . Linear span we have already seen, linear span of a set of vectors is nothing, but the set of all linear combinations of members of S . So, if we are taking a linear combination of u_1, u_2, \dots, u_m and W , so, this is an element of this set $L(S)$. I can this is let me call it $L(S)$. So, this is an element of $L(S)$ where S is u_1, u_2, \dots, u_m and W .

So, when you take any linear combination of u_1, u_2, \dots, u_m and W it is an element of $L(S)$. Since u_1, u_2, \dots, u_m belong to S they belong to V and W is also an element of V . So, u_1, u_2, \dots, u_m and W belong to V and V is a vector space. Hence, this linear combination let me call this linear combination as the element v . So, then hence v belongs to V . So, this $L(S)$ is contained in V .

Now, if I take any element in V , I should show that I can write it as a linear combination of u_1, u_2, \dots, u_m and W or if I take conversely let us take any element. Conversely I take any element u belonging to V then I can then since u_1, u_2, \dots, u_m is span V then I then u is equal to $\sum_{j=1}^m \alpha_j u_j$, j equal to 1 to m and this is also equal to $\sum_{j=1}^m \alpha_j u_j + 0 \cdot W$. I can write it like this where 0 is the 0 scalar and W is the W vector. So, u is a linear combination of u_1, u_2, \dots, u_m and W . So, this means that, u belongs to $L(S)$ and therefore, V is subset of $L(S)$. So, $L(S)$ is equal to V .

So, if u_1, u_2, \dots, u_m span V than W is any vector in V then W, u_1, u_2, \dots, u_m also spans V . Now, in the remark 2 we say that if u_1, u_2, \dots, u_m span V and u_k is a combination one of the elements u_k here in u_1, u_2, \dots, u_n is a linear combination of some other use, then the use without u_k will also span it is also very simple we can easily show this and let u_1, u_2, \dots, u_n span V and suppose one of the vectors one of the u is a 0 vector, then the use without the 0 vector will span V . So, these are simple observations now let us look at some examples of subspaces.

(Refer Slide Time: 26:57)

Examples of subspaces

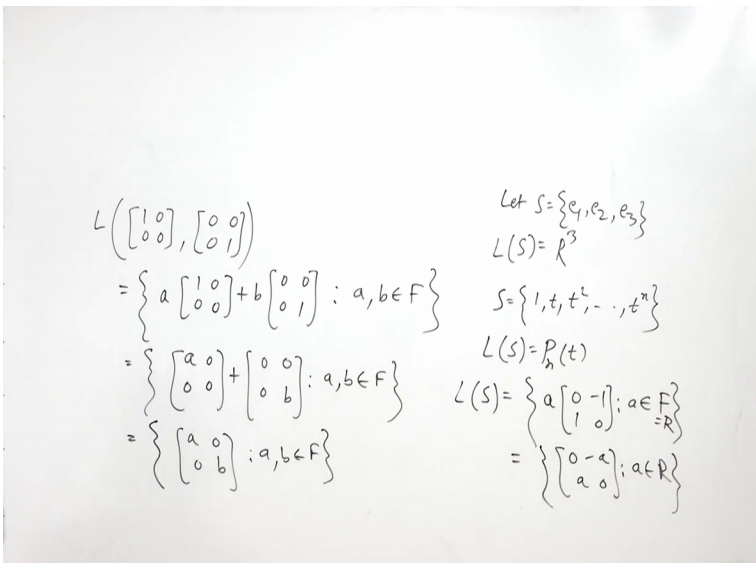

- The span of $\begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix}$ and $\begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix}$ consists of all matrices of the form

$$a \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix} + b \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix}$$
 This is the subspace of all diagonal matrices.
- Vectors $e_1 = (1,0,0)$, $e_2 = (0,1,0)$ and $e_3 = (0,0,1)$ form a spanning set of \mathbb{R}^3 because

$$(x,y,z) = x(1,0,0) + y(0,1,0) + z(0,0,1)$$

(Refer Slide Time: 27:00)

$$L\left(\begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix}, \begin{bmatrix} 0 & 0 \\ 0 & 1 \end{bmatrix}\right)$$

$$= \left\{ a \begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix} + b \begin{bmatrix} 0 & 0 \\ 0 & 1 \end{bmatrix} : a, b \in F \right\}$$

$$= \left\{ \begin{bmatrix} a & 0 \\ 0 & 0 \end{bmatrix} + \begin{bmatrix} 0 & 0 \\ 0 & b \end{bmatrix} : a, b \in F \right\}$$

$$= \left\{ \begin{bmatrix} a & 0 \\ 0 & b \end{bmatrix} : a, b \in F \right\}$$

$$\text{Let } S = \{e_1, e_2, e_3\}$$

$$L(S) = \mathbb{R}^3$$

$$S = \{1, t, t^2, \dots, t^n\}$$

$$L(S) = \mathcal{P}_n(t)$$

$$L(S) = \left\{ a \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix} : a \in F \right\}$$

$$= \left\{ \begin{bmatrix} 0 & -a \\ a & 0 \end{bmatrix} : a \in \mathbb{R} \right\}$$

So, the first example is let us consider the linear span of $\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$ and $\begin{bmatrix} 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 1 \end{bmatrix}$, this our set S. So, S is the set of two matrices; one is $\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$ the other one is $\begin{bmatrix} 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 1 \end{bmatrix}$. Now, L S will be the set of all linear combination of. So, these two, a times $\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$ plus b times $\begin{bmatrix} 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 1 \end{bmatrix}$, where a, b belongs to the field F and this is what a 0 here 0 we have. So, here all non diagonal elements are zeroes. So, L S where S is these 2 matrices L S is the set of all 2 by 2 diagonal matrices. So, linear span of these 2 matrices is the subspace of all diagonal matrices.

(Refer Slide Time: 28:43)

Examples of subspaces

- The span of $\begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix}$ and $\begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix}$ consists of all matrices of the form
$$a \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix} + b \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix}.$$
This is the subspace of all diagonal matrices.
- Vectors $e_1=(1,0,0)$, $e_2=(0,1,0)$ and $e_3=(0,0,1)$ forms a spanning of R^3 because
$$(x,y,z) = x(1,0,0) + y(0,1,0) + z(0,0,1)$$

 4

Now, let us take another example of suppose we take the vectors e_1 equal to 1, 0, 0, e_2 equal to 0, 1, 0 and e_3 equal to 0, 0, 1 then the linear span of these 3 vectors $L = e_1, e_2, e_3$ is nothing, but the whole of R^3 . So, let $S = e_1, e_2, e_3$ then linear span of S is equal to R^3 , because any element in R^3 that is x, y, z can be written as a linear combination of 1, 0, 0, 0, 1, 0 and 0, 0, 1. So, the span subspace of R^3 .

(Refer Slide Time: 29:26)

- Consider the vector space $P_n(t)$ consisting of all polynomials of degree $\leq n$ such that every polynomial in $P_n(t)$ can be expressed as a linear combination of $n+1$ polynomials. Thus all powers of t till the degree n form a spanning set.
- The span of $\begin{pmatrix} 0 & -1 \\ 1 & 0 \end{pmatrix}$ is the subspace of all the anti symmetric matrix.
- The vector space $V=P(t)$ of real polynomials can not be spanned by a finite number of polynomials.

 5

Let us consider the vector space $P_n(t)$ consisting of all polynomials of degree less than or equal to n , such that every polynomial in $P_n(t)$ can be expressed as a linear combination

of $n + 1$ polynomials, then all powers of t till the degree n say, one t t square t to the power n their linear span will be the vector space P_n .

Now, let us go to the span of the linear span of $0, \text{minus } 1, 1, 0$ will be the subspace of all anti symmetric matrices. 0 see linear span of. So, where F we are taking as equal to \mathbb{R} the set of real numbers the field is of real numbers. So, here we have $0, \text{minus } a, a, 0$. So, it is the subspace of all S symmetric matrices. Now, it is clear that the vector space of all real polynomials cannot be spanned by a finite number of polynomial.

(Refer Slide Time: 30:47)

• Consider the following two sets of \mathbb{R}^4 :

$$u_1 = (1, 2, -1, 3), \quad u_2 = (2, 4, 1, -2), \quad u_3 = (3, 6, 3, -7)$$

$$w_1 = (1, 2, -4, 11), \quad w_2 = (2, 4, -5, 14)$$

Let $U = \text{span}(u_i)$ and $W = \text{span}(w_i)$ then prove $U = W$.

Soln. Form the matrix A whose rows are u_1, u_2, u_3 and row reduce A to row canonical form and form the matrix B whose rows are w_1 and w_2 and row reduce B to row canonical form.

IIIT ROORKEE | NPTEL ONLINE CERTIFICATION COURSE | 6

Now, let us go to the following set 2 sets of \mathbb{R}^4 ; one set of \mathbb{R}^4 is consisting of 3 vectors u_1, u_2, u_3 . u_1 is $1, 2, \text{minus } 1, 3$; u_2 is $2, 4, 1, \text{minus } 2$; u_3 is $3, 6, 3, \text{minus } 7$. The other set is consisting of two vectors w_1 and w_2 . w_1 is $1, 2, \text{minus } 4, 1$; w_2 is $2, 4, \text{minus } 5$ and 14 and then we can find the span of u_1, u_2, u_3 and also the span of w_1, w_2 and then show that the two are equal to generate the same space. So, let us see how we prove this.

(Refer Slide Time: 31:36)

$$A = \begin{bmatrix} u_1 \\ u_2 \\ u_3 \end{bmatrix} = \begin{bmatrix} 1 & 2 & -1 & 3 \\ 2 & 4 & 1 & -2 \\ 3 & 6 & 3 & -7 \end{bmatrix}$$

$$\begin{array}{l} R_2 \rightarrow R_2 - 2R_1 \\ R_3 \rightarrow R_3 - 3R_1 \\ R_3 \rightarrow R_3 - 2R_2 \end{array} \begin{bmatrix} 1 & 2 & -1 & 3 \\ 0 & 0 & 3 & -8 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

$$B = \begin{bmatrix} w_1 \\ w_2 \end{bmatrix} = \begin{bmatrix} 1 & 2 & -4 & 11 \\ 2 & 4 & -5 & 14 \\ 0 & 0 & 3 & -8 \end{bmatrix}$$

$$\begin{array}{l} R_2 \rightarrow R_2 - 2R_1 \\ R_3 \rightarrow R_3 - 2R_1 \end{array} \begin{bmatrix} 1 & 2 & -4 & 11 \\ 0 & 0 & 3 & -8 \\ 0 & 0 & 1 & -8 \end{bmatrix}$$

So, let us form the matrixes whose rows are u_1 , u_2 and u_3 . So, first we take A whose rows are u_1 , u_2 , u_3 ; u_1 is $1\ 2\ -1\ 3$, u_2 is $2\ 4\ 1\ -2$ and u_3 is $3\ 6\ 3\ -7$. Let us; then row reduce this matrix to canonical form. Canonical form means V will reduce it to echelon form and then row reduce it to echelon form, that is, will make the leading coefficients of all non zero entries in each row to be equal to 1, such that it is the only non zero entry in it is corresponding column.

So, what we do? We will do elementary row operations on this. So, in order to reduce it to echelon form we will make this entry 0, this entry because number of zeros preceding the first non zero entry should increase row by row. So, we will put an equivalent sign here, now to make this 0 with the help of this we multiply this by 2 and then subtract from here. So, let me call this as R_1 row this R_2 row, this R_3 row. So, will do R_2 goes to $R_2 - 2R_1$ and then from this 3 times this we subtract from here. So, R_3 goes to $R_3 - 3R_1$. Let us make this 2 operations. So, $1\ 2\ -1\ 3$, here we will get 0 we will get 0 here again. So, we multiply 2 and subtract here, this should become one plus 2 that is 3 and this will be 6, we will get minus 8 here and then this will be 0, this will be 0 and then 3 plus 3 will become 6 and here we will get 9, 9 will give you minus 16.

Now, number of zeroes preceding these first non zero entry here is 2 and here also it is 2. So, let us make this entry 0 with the help of this one. So, this we say R_3 goes to $R_3 - 2R_2$ and we write $1\ 2\ -1\ 3$ and then $0\ 0\ 3\ -8$ and then $0\ 0\ 0\ 0$. Now,

this matrix is in echelon form, but we have to reduce it to canonical form. So, here the first leading coefficient is 1, this is not 1. So, let us make this also equal to 1. So, we divide second row by 3. So, we write R_2 goes to R_2 by 3 and then we get $1 \ 2 \ \text{minus } 1 \ 3 \ 0 \ 0 \ 1$ and then here minus 8 by 3 and then $0 \ 0 \ 0 \ 0$.

So, the matrix A is reduce to row canonical form. The similarly we form the matrix B with the vectors w_1, w_2 . So, let us consider the matrix B equal to B we will form with the vectors w_1 and w_2 . So, this equal to $1, 2, \text{ minus } 4, 11$ and then $2, 4, \text{ minus } 5, 14$. So, reduce it to equivalent form. So, we get we do R_2 goes to R_2 minus $2R_1$ then this is $1, 2, \text{ minus } 4, 11$ this will become 0, this will become 0, here we will get 3, here we are subtracting 22 from 14. So, we get minus 8. Now, here the first coefficient first entry is 1, but here it is 3. So, make it 1 by dividing second row by 3. So, this is change to R_2 goes to R_2 by 3 and we get $1, 2, \text{ minus } 4, 11, 0, 0, 1, \text{ minus } 8$ by 3.

Now, we can see that A is row reduced to this matrix, third row is a 0 row. When we take linear combination of these elements third row does not contribute anything. So, this matrix we can regard will generate the same space as this matrix because the 0 vector does not contribute anything to the linear combination. So, we can say that when we reduce A and V to canonical form, row canonical form their span the same space. So, this they span U and W, then U and W must be equal.

(Refer Slide Time: 36:43)

Since the non zero rows of the matrices in row canonical form are identical, so $U=W$.

IIT ROORKEE NPTEL ONLINE CERTIFICATION COURSE 9

This is what we are saying in this example, the non zero rows of the matrices in row canonical form are identical, so U is equal to W . So, with that we would like to conclude our lecture. Thank you very much for your attention.
