Lecture - 11
Change of Variables

Hello friends. So, welcome to lecture series on multivariable calculus. So, we have already discussed what chain rule are? And how we can apply chain rule on several variable functions? Now change of variables ok. So, what change of variables are? Let us; see, suppose z is a function of x and y .

(Refer Slide Time: 00:41)

Again suppose z is a function of 2 variables x and y , x and y are independent variable and z is a dependent variable. Now x and y suppose x is the function of u and v again and y is again a function of u and v .

So, we already know, that if you want to compute say $\frac{\partial f}{\partial u}$ by the chain rule we can write $\frac{\partial f}{\partial u}$ by $\frac{\partial f}{\partial x}$ into $\frac{\partial x}{\partial u}$ plus $\frac{\partial f}{\partial y}$ into $\frac{\partial y}{\partial u}$. Because f is a function of x and y , and x and y both are the function of u ok. Similarly, $\frac{\partial f}{\partial v}$ will be $\frac{\partial f}{\partial x}$ into $\frac{\partial x}{\partial v}$ plus $\frac{\partial f}{\partial y}$ into $\frac{\partial y}{\partial v}$. This we can also understand by t diagram, as I already discussed, z is a function of x and y and x and y both are the functions of u .

So, it is del f by del x it is del x by del u here it is del f by del y here it is del y by del u. So, del f by del u will be this into this plus this into this which is this term ok. And similarly, if z is a function of x and y, and you want to compute del f by del v. So, it is del f by del x, it is del x by del v, it is del f by del y, it is del y by del v. So, del f by del v will be this into this plus this into this, that is this term ok.

Now, basically let us compute del f by del x and del f by del y from these 2 equations ok. What are the equations we are having here? It is f x into del x by del u plus f y into del y by del u is equals to f u, this is the first equation ok. The second equation is f x into del x by del v plus f y into del y by del v is equal to f v. So, these are 2 equations we are having. Now basically these are the 2 system of equations ok.

(Refer Slide Time: 03:47)

$$\begin{aligned}
 &Z = f(x, y), \quad x = \phi(u, v) \\
 &\quad \quad \quad y = \psi(u, v) \\
 &\frac{\partial f}{\partial u} = \frac{\partial f}{\partial x} \frac{\partial x}{\partial u} + \frac{\partial f}{\partial y} \frac{\partial y}{\partial u} \\
 &\frac{\partial f}{\partial v} = \frac{\partial f}{\partial x} \frac{\partial x}{\partial v} + \frac{\partial f}{\partial y} \frac{\partial y}{\partial v} \\
 &\left[\begin{array}{cc|c} \frac{\partial x}{\partial u} & \frac{\partial y}{\partial u} & f_u \\ \frac{\partial x}{\partial v} & \frac{\partial y}{\partial v} & f_v \end{array} \right] \rightarrow \left[\begin{array}{cc|c} f_x & f_y & f_u \\ f_x & f_y & f_v \end{array} \right] \\
 &\frac{x}{\begin{vmatrix} c_1 & b_1 \\ c_2 & b_2 \end{vmatrix}} = \frac{-y}{\begin{vmatrix} c_1 & a_1 \\ c_2 & a_2 \end{vmatrix}} = \frac{1}{\begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix}} \\
 &\frac{x}{\begin{vmatrix} f_u & \frac{\partial y}{\partial u} \\ f_v & \frac{\partial y}{\partial v} \end{vmatrix}} = \frac{-f_y}{\begin{vmatrix} f_u & \frac{\partial x}{\partial u} \\ f_v & \frac{\partial x}{\partial v} \end{vmatrix}} = \frac{1}{\begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial y}{\partial u} \\ \frac{\partial x}{\partial v} & \frac{\partial y}{\partial v} \end{vmatrix}}
 \end{aligned}$$

Let us try to compute f x and f y in terms of f u and f v ok. So, how can we compute? We already know Cramer rule it is a 1 x plus b 1 y plus is equal to c 1 and a 2 x plus b 2 y is equal to c 2, then it is x upon, it is c 1 c 2 b 1 b 2 minus y upon determinant c 1 c 2 a 1 a 2 and 1 upon determinant a 1 a 2 b 1 b 2. So, this is a simple Cramer rule by which we can find the values of x and y.

Now, suppose, because these are the unknown's f x and f y are the unknowns ok. So, they may be treated as x and y. And this is a 1, this is a 2, this is c 1 this is a 2, b 2 and c 2. So, let us compute f x and f y from these 2 equations. So, similarly from these 2 equations it is f x upon determinant of it is f u f v c 1 c 2, and then b 1 b 2. It is these 2;

that is del y by del u upon del y by del v, which is equals to minus f y upon determinant of c 1, c 2. Again c 1 c 2 which is f u f v ok. And then a 1, a 2, a 1 is this, a 2 is this that is del x by del u and del x by del v and is equals to 1 upon determinant of a 1 a 2 b 1 b 2; that is, del x by determinant of del x by del u, del x by del v, and then it is del y by del u and del y by del v ok.

Now, this term this determinant is basically this determinant, this determinant del x upon del u, del y upon del u, del x upon del v del y upon del v is also denoted by del of x y upon del of u v.

(Refer Slide Time: 06:04)

Handwritten mathematical derivations on a whiteboard:

$$Z = f(x, y), \quad x = \phi(u, v) \\ y = \psi(u, v)$$

$$\begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial y}{\partial u} \\ \frac{\partial x}{\partial v} & \frac{\partial y}{\partial v} \end{vmatrix} = \frac{\partial(x, y)}{\partial(u, v)} = J = \text{Jacobian}$$

$$\begin{aligned} a_1 x + b_1 y &= c_1 \\ a_2 x + b_2 y &= c_2 \end{aligned}$$

$$\frac{x}{\begin{vmatrix} c_1 & b_1 \\ c_2 & b_2 \end{vmatrix}} = \frac{-y}{\begin{vmatrix} c_1 & a_1 \\ c_2 & a_2 \end{vmatrix}} = \frac{1}{\begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix}}$$

Therefore,

$$f_x = \frac{1}{J} \begin{vmatrix} \frac{\partial f}{\partial u} & \frac{\partial y}{\partial u} \\ \frac{\partial f}{\partial v} & \frac{\partial y}{\partial v} \end{vmatrix} = \frac{1}{J} \left[\frac{\partial(f, y)}{\partial(u, v)} \right]$$

$$f_y = -\frac{1}{J} \left[\frac{\partial(f, x)}{\partial(u, v)} \right]$$

$$\begin{vmatrix} f_x & \frac{\partial x}{\partial u} \\ f_y & \frac{\partial y}{\partial u} \end{vmatrix} = \frac{-f_y}{\begin{vmatrix} f_u & \frac{\partial x}{\partial u} \\ f_v & \frac{\partial x}{\partial v} \end{vmatrix}} = \frac{1}{\begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial y}{\partial u} \\ \frac{\partial x}{\partial v} & \frac{\partial y}{\partial v} \end{vmatrix}}$$

Which we call as denoted by J and it is called Jacobean. Jacobian of x and y ok. This is denoted by j, this term which is this determinant, and this is called we call it Jacobean ok. So, we can write f x as from this equation, f x can written as therefore, f x will be 1 upon J times. Because when you compare this with this term; it is 1 upon J, J is this term ok, 1 upon J and this will this will go to a numerator. So, this will be determinant of del f upon del u, del y upon del u, del f upon del v, del y upon del v; which is 1 upon J times, it is del of f y upon del of u v.

Ok, that means, del f upon del u del y upon del u del f upon del v and del y upon del v ok. Similarly, f y will be minus 1 upon J this will go to a numerator, and this will be del of f x upon del of u v. Which is del f upon del u, del f upon del v, del x upon del u del x upon del v, this term. So, that is how we can compute f x and f y if we know the values

of $\frac{\partial f}{\partial u}$ upon $\frac{\partial f}{\partial v}$ or $\frac{\partial f}{\partial u}$ upon $\frac{\partial f}{\partial v}$. So, this is basically change of variables. So, that is what this given the PPT, that is $\frac{\partial f}{\partial x}$ is 1 upon J times $\frac{\partial f}{\partial y}$ upon $\frac{\partial f}{\partial u}$ and $\frac{\partial f}{\partial v}$.

(Refer Slide Time: 08:30)

Continued...

The determinant

$$J = \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \end{vmatrix} = \frac{\partial(x, y)}{\partial(u, v)}$$

is called the Jacobian of the variables of transformation.

From (1), we obtain

$$\frac{\partial f}{\partial x} = \frac{1}{J} \left[\frac{\partial(f, y)}{\partial(u, v)} \right]$$

$$\frac{\partial f}{\partial y} = -\frac{1}{J} \left[\frac{\partial(f, x)}{\partial(u, v)} \right]$$

IT ROORKEE NPTEL ONLINE CERTIFICATION COURSE 3

Similarly, $\frac{\partial f}{\partial y}$ upon $\frac{\partial f}{\partial x}$ will be minus 1 upon J times $\frac{\partial f}{\partial x}$ upon $\frac{\partial f}{\partial u}$ and $\frac{\partial f}{\partial v}$ ok.

Now, let us try to solve some problems based on this. Then we will see some other properties of Jacobian. So, first problem is here z is a function of x and y and x is $r \cos \theta$ and y is $r \sin \theta$.

(Refer Slide Time: 09:00)

$z = f(x, y), \quad x = r \cos \theta, \quad y = r \sin \theta$

$f_x = \frac{1}{J} \left[\frac{\partial(f, y)}{\partial(r, \theta)} \right]$

$\frac{\partial(f, y)}{\partial(r, \theta)} = \begin{vmatrix} \frac{\partial f}{\partial r} & \frac{\partial f}{\partial \theta} \\ \frac{\partial y}{\partial r} & \frac{\partial y}{\partial \theta} \end{vmatrix}$

$= \begin{vmatrix} f_r & f_\theta \\ \sin \theta & r \cos \theta \end{vmatrix}$

$= (r \cos \theta) f_r - f_\theta (\sin \theta)$

$f_x = \frac{1}{J} \left[r \cos \theta f_r - \sin \theta f_\theta \right]$

And y is $r \sin \theta$. So, we have to prove that $f_x^2 + f_y^2$ is equal to $f_r^2 + \frac{1}{r^2} f_\theta^2$. So, let us try to prove this; so, f_x as we already know that f_x is $\frac{1}{J} \frac{\partial f}{\partial r}$ and f_y is $\frac{1}{J} \frac{\partial f}{\partial \theta}$. Because instead of u and v , here we are having r in θ u is r and v is θ ok.

So, first let us compute J . J is Jacobian is $\frac{\partial x}{\partial r} \frac{\partial y}{\partial \theta} - \frac{\partial x}{\partial \theta} \frac{\partial y}{\partial r}$. It is determinant of $\frac{\partial x}{\partial r} \frac{\partial x}{\partial \theta}$, $\frac{\partial y}{\partial r} \frac{\partial y}{\partial \theta}$, which is equal to; now what is $\frac{\partial x}{\partial r}$ from here? It is $\cos \theta$. $\frac{\partial x}{\partial \theta}$ it is $-r \sin \theta$. $\frac{\partial y}{\partial r}$ is $\sin \theta$. And $\frac{\partial y}{\partial \theta}$ is $r \cos \theta$. When you take the determinant, it is $r \cos^2 \theta + \sin^2 \theta$, which is r into 1 which is r ok.

Now, what is $\frac{\partial f}{\partial y}$ upon $\frac{\partial f}{\partial r}$ theta, it is determinant of $\frac{\partial f}{\partial r} \frac{\partial f}{\partial \theta}$ del θ del y upon $\frac{\partial f}{\partial r}$ del y upon $\frac{\partial f}{\partial \theta}$, which is equal to determinant of it remain as it is f_r , f_θ remain as it is. And $\frac{\partial y}{\partial r}$ from here is $\sin \theta$, and $\frac{\partial y}{\partial \theta}$ is $r \cos \theta$. So, the determinant will be $r \cos \theta$ into f_r minus f_θ into $\sin \theta$. So, what will be f_x then. So, f_x will be $\frac{1}{r} \frac{\partial f}{\partial r}$ because J is r ok. And this value is this thing and times it is $r \cos \theta$ f_r minus $\sin \theta$ into f_θ . So, this is f_x .

Now, similarly how can you find f_y .

(Refer Slide Time: 11:55)

$$Z = f(x, y), \quad x = r \cos \theta, \quad y = r \sin \theta$$

$$f_x = \frac{1}{J} \left[\frac{\partial f}{\partial r} \right]$$

$$f_y = -\frac{1}{J} \left[\frac{\partial f}{\partial \theta} \right]$$

$$\frac{\partial f}{\partial (x, y)} = \begin{vmatrix} \frac{\partial f}{\partial r} & \frac{\partial f}{\partial \theta} \\ \frac{\partial x}{\partial r} & \frac{\partial x}{\partial \theta} \end{vmatrix} = \begin{vmatrix} f_r & f_\theta \\ \cos \theta & -r \sin \theta \end{vmatrix}$$

$$= -r \sin \theta f_r - f_\theta (\cos \theta)$$

Now, f_y will be minus 1 by J times del of f_x upon del of r theta. So now, let us compute this we already know J is r . So, let us compute this term this, this term is del of f_x upon del of r theta, which is determinant of del f upon del r del f upon del theta, del x upon del r , and del x upon del theta. And it is equal to it is f_r , it is f_θ del x upon del r from here, it is $\cos \theta$ and del x upon del theta is minus $r \sin \theta$. So, this value will be minus $r \sin \theta f_r$ and minus f_θ into $\cos \theta$.

(Refer Slide Time: 12:55)

The whiteboard contains the following derivations:

$$Z = f(r, \theta), \quad \begin{matrix} x = r \cos \theta \\ y = r \sin \theta \end{matrix}$$

$$f_x = \frac{1}{J} \left[\frac{\partial(f, y)}{\partial(r, \theta)} \right]$$

$$f_y = \frac{1}{J} \left[\frac{\partial(f, x)}{\partial(r, \theta)} \right]$$

$$J = \begin{vmatrix} \frac{\partial x}{\partial r} & \frac{\partial x}{\partial \theta} \\ \frac{\partial y}{\partial r} & \frac{\partial y}{\partial \theta} \end{vmatrix} = \begin{vmatrix} \cos \theta & -r \sin \theta \\ \sin \theta & r \cos \theta \end{vmatrix} = r \cos^2 \theta + r \sin^2 \theta = r$$

$$f_x = \frac{1}{r} [r \cos \theta f_r - r \sin \theta f_\theta]$$

$$f_y = \frac{1}{r} [r \sin \theta f_r + r \cos \theta f_\theta]$$

$$f_x^2 + f_y^2 = \frac{1}{r^2} [r^2 f_r^2 (\cos^2 \theta + \sin^2 \theta) + r^2 f_\theta^2 (\sin^2 \theta + \cos^2 \theta)]$$

$$= f_r^2 + f_\theta^2$$

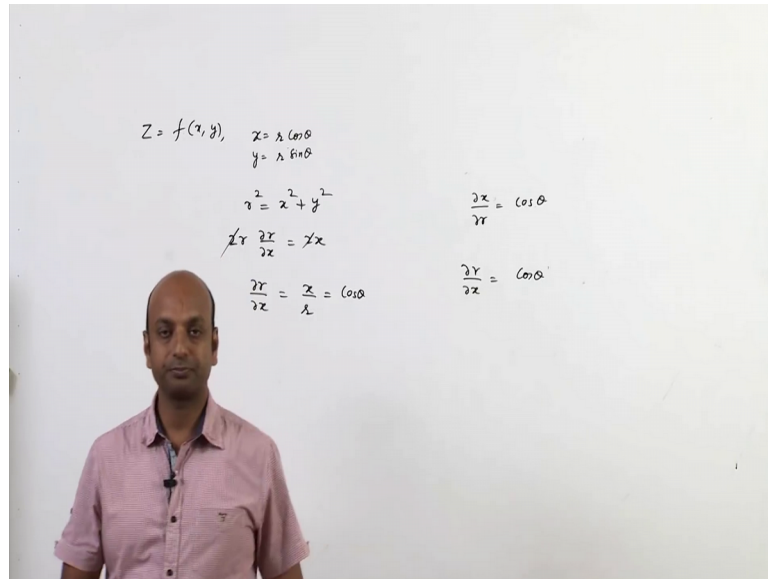

So, so, what will be f_y , then f_y will be so, negative will be cancelled from this negative. So, it will be 1 by r times $r \sin \theta$ into f_r plus $\cos \theta$ into f_θ . So, what will be $f_x^2 + f_y^2$, this we have to compute ok. We have to compute $f_x^2 + f_y^2$. So, square and add both the equations. So, when we square and add we get 1 by r^2 times. It is a square $a - b$ whole square it is a plus b whole square.

So, it will be r^2 times f_r^2 will be common it is $\cos^2 \theta + \sin^2 \theta$ from this side. From this side it is f_θ^2 and it is $\sin^2 \theta + \cos^2 \theta$. And 2 times this into this, and 2 times this into this will be cancel out. Because they are having opposite sign. So, what we are getting from here? r^2 square also cancel out it is $f_r^2 + f_\theta^2$. So, hence we have proved, hence we have proved this problem.

So, that is how using change of variables also, we can show such type of problems. We can directly use chain rule also no problem. But we can also show we can also try to

solve this problems using change of variables. In the same problem, I want to emphasize one more property which is you see, you see a when we deal with single variable functions say y equal to $f(x)$. Then we can always right dy by dx is equal to reciprocal of dx by dy . That is always true for single variable functions, but it may not be true for partial derivatives. Let us see what is $\frac{\partial x}{\partial r}$ from here.

(Refer Slide Time: 15:01)

The whiteboard contains the following derivations:

$$Z = f(x, y), \quad x = r \cos \theta, \quad y = r \sin \theta$$

$$r^2 = x^2 + y^2$$

$$\frac{\partial}{\partial r} \frac{\partial r}{\partial x} = \frac{\partial^2 r}{\partial x^2}$$

$$\frac{\partial r}{\partial x} = \frac{x}{r} = \cos \theta$$

$$\frac{\partial r}{\partial x} = \cos \theta$$

it is $\cos \theta$ ok.

Now, if you want to compute $\frac{\partial r}{\partial x}$, what it will be. Now we cannot compute $\frac{\partial r}{\partial x}$ upon $\frac{\partial x}{\partial r}$ from this equation. We first have to express r in terms of independent variables. Now for r independent variables are x and y . So, what will be equation of r in terms of x and y it is $r^2 = x^2 + y^2$ ok. Not from this question, because this r equal to $x \sec \theta$, but $\sec \theta$, but this $\sec \theta$ ok.

We cannot differentiate from here. Partially because, we have to express r in terms of independent variables ok, x and y are independent not x and θ ok. So, what will what will be $\frac{\partial r}{\partial x}$ from here. It is $2r \frac{\partial r}{\partial x} = 2x$ 2 cancels out. So, $\frac{\partial r}{\partial x}$ by $\frac{\partial x}{\partial r}$ is equals to x by r , and x by r from here it is $\cos \theta$. So, it is also $\cos \theta$. So, we have seen that $\frac{\partial r}{\partial x}$ is not reciprocal of $\frac{\partial x}{\partial r}$.

Now, let us come to second problem. Second problem is here z is function of x and y .

(Refer Slide Time: 16:37)

$$z = f(x, y), \quad x = e^u \cos v$$

$$y = e^u \sin v$$

$$z_x = \frac{1}{J} \left[\frac{\partial f}{\partial u} \right], \quad z_y = -\frac{1}{J} \left[\frac{\partial f}{\partial v} \right]$$

$$\frac{\partial f}{\partial u} = \begin{vmatrix} \frac{\partial f}{\partial x} & \frac{\partial f}{\partial y} \\ \frac{\partial x}{\partial u} & \frac{\partial y}{\partial u} \end{vmatrix} = \begin{vmatrix} f_x & f_y \\ e^u \cos v & e^u \sin v \end{vmatrix}$$

$$= e^{2u} [\cos v f_y - \sin v f_x]$$

$$J = \frac{\partial(x, y)}{\partial(u, v)} = \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \end{vmatrix} = \begin{vmatrix} e^u \cos v & -e^u \sin v \\ e^u \sin v & e^u \cos v \end{vmatrix}$$

$$= e^{2u}$$

and x is x is e raise to power $u \cos v$ and y is again e raise to power u . It is $\sin v$. And then we have to show that $z_x^2 + z_y^2$ is equal to this expression ok. So, how can we prove this is it, this is it ok. So, first we compute z_x , z_x z_x or f_x both are same. So, how to compute this is 1 by J times $\frac{\partial f}{\partial u}$ upon $\frac{\partial f}{\partial u}$. Here independent variables are u and v . And what will be z_y z_y will be minus 1 by J times $\frac{\partial f}{\partial v}$ upon $\frac{\partial f}{\partial v}$.

So, first we compute J . So, what will be J ? J will be $\frac{\partial(x, y)}{\partial(u, v)}$, which is equal determinant of $\frac{\partial x}{\partial u}$ upon $\frac{\partial x}{\partial v}$ $\frac{\partial y}{\partial u}$ and $\frac{\partial y}{\partial v}$. And this further equal to $\frac{\partial x}{\partial u}$ from here is e raise to power $u \cos v$, it is minus e raise to power $u \sin v$, it is e raise to power $u \sin v$, and it is e raise to power $u \cos v$. And it is equals to e raise to power $2u$. Because $\sin^2 + \cos^2$ is 1 .

Now, let us compute this term. This term is $\frac{\partial f}{\partial u}$ upon $\frac{\partial f}{\partial u}$, which is equal to determinant of $\frac{\partial f}{\partial x}$ upon $\frac{\partial f}{\partial y}$ $\frac{\partial x}{\partial u}$ and $\frac{\partial x}{\partial v}$. Which is equals to determinant of f_x , f_y . This term is e raise to power $u \sin v$ and this is e raise to power $u \cos v$, and this is e raise to power u will can come out. And it is $\cos v f_y - \sin v f_x$ ok. So, this is this term. Now what will be $\frac{\partial f}{\partial v}$; now what will be this term? So, this we have to remember that J is e raise to power $2u$, now let us compute $\frac{\partial f}{\partial v}$ upon $\frac{\partial f}{\partial v}$ it is equals to again $f_y f_v$.

(Refer Slide Time: 19:30)

Handwritten derivation on a whiteboard:

$$z = f(x, y), \quad x = e^u \cos v, \quad y = e^u \sin v$$

$$z_x = \frac{1}{J} \left[\frac{\partial(f, y)}{\partial(u, v)} \right], \quad z_y = -\frac{1}{J} \left[\frac{\partial(f, x)}{\partial(u, v)} \right]$$

$$\frac{\partial(f, y)}{\partial(u, v)} = \begin{vmatrix} \frac{\partial f}{\partial u} & \frac{\partial f}{\partial v} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \end{vmatrix} = \begin{vmatrix} f_u & f_v \\ e^u \sin v & e^u \cos v \end{vmatrix}$$

$$= e^u [\cos v f_u - \sin v f_v]$$

$$z_x = e^{-u} [\cos v f_u - \sin v f_v]$$

$$z_y = e^{-u} [\sin v f_u + \cos v f_v]$$

$$\frac{\partial(f, x)}{\partial(u, v)} = \begin{vmatrix} \frac{\partial f}{\partial u} & \frac{\partial f}{\partial v} \\ \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \end{vmatrix} = \begin{vmatrix} f_u & f_v \\ e^u \cos v & -e^u \sin v \end{vmatrix}$$

$$= e^u [-\sin v f_u - \cos v f_v]$$

Then del x by del u del x by del u from here is e raise to power u cos v and del x by del v is e minus e raise to power u sin v. And determinant will be e raise to power u can come out minus sin v f u minus cos v f v ok.

So, what will be z x? So, z x will be 1 upon J times this quantity. So, 1 upon J time this quantity, J is e raise to power 2 u. So, it is e raise to power minus u times cos v f u minus sin v f v. And what will be z y? Again, e raised to power minus u times, this negative will cancel out. So, it is sin v, f v oh f u plus cos v f v. Now you simply square and add both the equations, when you square and add both the equations J x square plus z y square, it is e raise to power minus 2 u will come out. It is f u square because, this square plus this square is 1. It is f v square because this square plus this square is one and the product term will cancel out because there having a opposite sin. So, we have proved the result.

Now, we have some properties of Jacobean. So, let us try to show property these properties one by one. So, the first property is if J is del of u v upon del of x y.

(Refer Slide Time: 21:20)

The whiteboard shows the following handwritten content:

$$J = \frac{\partial(x, y)}{\partial(u, v)}$$

$$J' = \frac{\partial(u, v)}{\partial(x, y)}$$

$$JJ' = 1$$

$$JJ' = \begin{vmatrix} \frac{\partial u}{\partial x} & \frac{\partial u}{\partial y} \\ \frac{\partial v}{\partial x} & \frac{\partial v}{\partial y} \end{vmatrix} \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \end{vmatrix}$$

$$= \begin{vmatrix} \frac{\partial u}{\partial x} \frac{\partial x}{\partial u} + \frac{\partial u}{\partial y} \frac{\partial y}{\partial u} & \frac{\partial u}{\partial x} \frac{\partial x}{\partial v} + \frac{\partial u}{\partial y} \frac{\partial y}{\partial v} \\ \frac{\partial v}{\partial x} \frac{\partial x}{\partial u} + \frac{\partial v}{\partial y} \frac{\partial y}{\partial u} & \frac{\partial v}{\partial x} \frac{\partial x}{\partial v} + \frac{\partial v}{\partial y} \frac{\partial y}{\partial v} \end{vmatrix}$$

$$= \begin{vmatrix} 1 & 0 \\ 0 & 1 \end{vmatrix} = 1$$

$$\frac{\partial u}{\partial x} = \frac{\partial u}{\partial x} \frac{\partial x}{\partial u} + \frac{\partial u}{\partial y} \frac{\partial y}{\partial u}$$

And J dash is del of x y upon del of u v, then J into J dash is always 1. Then J into J dash is always 1. This is the first property, and the proof is very easy. So, what is J into J dash. J into J dash is this into this ok. Now this is determinant of del u by del x into del u by del y del v by del x into del v by del y. And this determinant J dash is this thing which is del x upon del u del x upon del v, then del y upon del u, and then del y upon del v ok. This is one determinant, and this is second determinant and the product of these 2 will be J into J dash.

Now, determinant of a matrix A and determinant of matrix B will be determinant of A into B, we already know this result. So, determinant of this into determinant of this will be determinant of this matrix into this matrix ok. Take this as a matrix the inside 2 cross 2 rectangular we are calling it a matrix, And this is a matrix so, determinant of A into determinant of B determinant of A into B. So now, we are computing A into B. So, this row this column which is del u by del x into del x by del u, plus del u by del y into del y by del u. This is the first term. The second term is, del u by del x into del x by del v plus del u by del y into del y by del v.

Similarly, the next 2 terms are this row this column. So, that that will be del v by del x into del x by del u plus del v by del y into del y by del u. And then this is del v by del x into del x by del v plus del v by del y into del y by del v. Now what is what is del u? Del u we can easily write it is del u by del x into del x plus del u by del y into del y ok.

Because u is a function of x and y ok. We can easily write this expression now divide the entire expression by $\frac{\partial u}{\partial u}$ ok. When you divide the entire expression by $\frac{\partial u}{\partial u}$. So, we obtain this term, and this upon this is 1. So, this term is the first term is 1.

Now, in the same expression, let us divide the entire expression by $\frac{\partial v}{\partial v}$. Now u and v are independent. So, $\frac{\partial u}{\partial v}$ is 0 ok. So, this is the value of this term is 0; that means, the value of this term is 0.

(Refer Slide Time: 25:18)

The whiteboard shows the following handwritten work:

$$J = \frac{\partial(u, v)}{\partial(x, y)}$$

$$J' = \frac{\partial(x, y)}{\partial(u, v)}$$

$$JJ' = 1$$

$$JJ' = \begin{vmatrix} \frac{\partial u}{\partial x} & \frac{\partial u}{\partial y} \\ \frac{\partial v}{\partial x} & \frac{\partial v}{\partial y} \end{vmatrix} \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \end{vmatrix}$$

$$= \begin{vmatrix} \frac{\partial u}{\partial x} \frac{\partial x}{\partial u} + \frac{\partial u}{\partial y} \frac{\partial y}{\partial u} & \frac{\partial u}{\partial x} \frac{\partial x}{\partial v} + \frac{\partial u}{\partial y} \frac{\partial y}{\partial v} \\ \frac{\partial v}{\partial x} \frac{\partial x}{\partial u} + \frac{\partial v}{\partial y} \frac{\partial y}{\partial u} & \frac{\partial v}{\partial x} \frac{\partial x}{\partial v} + \frac{\partial v}{\partial y} \frac{\partial y}{\partial v} \end{vmatrix}$$

$$= \begin{vmatrix} 1 & 0 \\ 0 & 1 \end{vmatrix} = 1$$

Below the determinant, the chain rule for $\frac{\partial u}{\partial x}$ is written:

$$\frac{\partial u}{\partial x} = \frac{\partial u}{\partial x} \frac{\partial x}{\partial x} + \frac{\partial u}{\partial y} \frac{\partial y}{\partial x}$$

Similarly when you find $\frac{\partial v}{\partial v}$ it is $\frac{\partial v}{\partial x} \frac{\partial x}{\partial v} + \frac{\partial v}{\partial y} \frac{\partial y}{\partial v}$. You divide the entire expression by $\frac{\partial u}{\partial u}$, when you divide the entire expression by $\frac{\partial u}{\partial u}$. So, $\frac{\partial u}{\partial u}$ and v are independent. So, this will be 0, hence the value of this expression will be 0. And when you divide the entire expression by $\frac{\partial v}{\partial v}$. So, $\frac{\partial v}{\partial v}$ by $\frac{\partial v}{\partial v}$ is 1. So, the value of this expression will be 1. So, determinant is 1. So, hence we have shown that J into J' is always 1.

(Refer Slide Time: 26:05)

Properties of Jacobians

- 1 If $J = \frac{\partial(u, v)}{\partial(x, y)}$ and $J' = \frac{\partial(x, y)}{\partial(u, v)}$ then $JJ' = 1$.
- 2 **Chain rule of Jacobians:** If u, v are functions of r, s and r, s are functions of x, y then

$$\frac{\partial(u, v)}{\partial(x, y)} = \frac{\partial(u, v)}{\partial(r, s)} \cdot \frac{\partial(r, s)}{\partial(x, y)}$$

Now, second property is chain rule type property of Jacobean. What it is del of u v upon del of x y?

(Refer Slide Time: 26:11)

$$\begin{aligned}
 \frac{\partial(u, v)}{\partial(x, y)} &= \frac{\partial(u, v)}{\partial(r, s)} \cdot \frac{\partial(r, s)}{\partial(x, y)} \\
 \text{RHS} \quad \begin{vmatrix} \frac{\partial u}{\partial r} & \frac{\partial u}{\partial s} \\ \frac{\partial v}{\partial r} & \frac{\partial v}{\partial s} \end{vmatrix} \begin{vmatrix} \frac{\partial r}{\partial x} & \frac{\partial r}{\partial y} \\ \frac{\partial s}{\partial x} & \frac{\partial s}{\partial y} \end{vmatrix} &= \begin{vmatrix} \frac{\partial u}{\partial r} \frac{\partial r}{\partial x} + \frac{\partial u}{\partial s} \frac{\partial s}{\partial x} & \frac{\partial u}{\partial r} \frac{\partial r}{\partial y} + \frac{\partial u}{\partial s} \frac{\partial s}{\partial y} \\ \frac{\partial v}{\partial r} \frac{\partial r}{\partial x} + \frac{\partial v}{\partial s} \frac{\partial s}{\partial x} & \frac{\partial v}{\partial r} \frac{\partial r}{\partial y} + \frac{\partial v}{\partial s} \frac{\partial s}{\partial y} \end{vmatrix} \\
 &= \begin{vmatrix} \frac{\partial u}{\partial x} & \frac{\partial u}{\partial y} \\ \frac{\partial v}{\partial x} & \frac{\partial v}{\partial y} \end{vmatrix} = \frac{\partial(u, v)}{\partial(x, y)} = \text{LHS}
 \end{aligned}$$

Can be written as del of u v upon del of r s into del of r s upon del of x y. So, this is basically chain rule properties of Jacobean ok. Another proof of this is also easy. Let us try to prove it, let us take the right-hand side. Right hand side is what? It is del u by del r in del u by del s, del v by del r and del v by del s. And determinant of this is del r by del x, del r by del y del s by del x, and del s by del y. Again, the determinant product of this

determinant is equal to determinant of this row this column which is $\frac{\partial u}{\partial r}$ by $\frac{\partial r}{\partial x}$ into $\frac{\partial r}{\partial y}$ by $\frac{\partial x}{\partial x}$. Plus, $\frac{\partial u}{\partial r}$ by $\frac{\partial x}{\partial x}$ into $\frac{\partial s}{\partial y}$ by $\frac{\partial x}{\partial x}$.

Then this row this column which is $\frac{\partial u}{\partial r}$ by $\frac{\partial r}{\partial y}$. This row this column into $\frac{\partial r}{\partial y}$ by $\frac{\partial y}{\partial y}$, plus $\frac{\partial u}{\partial s}$ by $\frac{\partial s}{\partial y}$ into $\frac{\partial s}{\partial y}$ by $\frac{\partial y}{\partial y}$. Now this row this column, which is $\frac{\partial v}{\partial r}$ by $\frac{\partial r}{\partial x}$ plus $\frac{\partial v}{\partial s}$ by $\frac{\partial s}{\partial x}$. Then this row this column the last one, that is $\frac{\partial v}{\partial r}$ by $\frac{\partial r}{\partial y}$ plus $\frac{\partial v}{\partial s}$ by $\frac{\partial s}{\partial y}$. Now the first term, first term is basically $\frac{\partial u}{\partial x}$ if you carefully see ah, this term this term basically u is a function of r n s ok.

So, when you apply chain rule. So, it is $\frac{\partial u}{\partial r}$ by $\frac{\partial r}{\partial x}$ plus $\frac{\partial u}{\partial s}$ by $\frac{\partial s}{\partial x}$. So, it is basically this term is basically $\frac{\partial u}{\partial x}$. Similarly, this term is basically $\frac{\partial u}{\partial y}$ again this is basically $\frac{\partial v}{\partial x}$ and this is $\frac{\partial v}{\partial y}$. So, it is nothing but $\frac{\partial u}{\partial x}$ $\frac{\partial v}{\partial y}$ upon $\frac{\partial x}{\partial x}$ $\frac{\partial y}{\partial y}$ which is left hand side. So, we have proved. So, this is chain rule of Jacobians.

Now, let us solve some problems based on this.

(Refer Slide Time: 29:08)

Handwritten on the whiteboard:

$$x = u(1-v)$$

$$y = uv$$

$$J = \frac{\partial(x, y)}{\partial(u, v)} = \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \end{vmatrix} = \begin{vmatrix} 1-v & -u \\ v & u \end{vmatrix} = u(1-v) + uv = u$$

$$J' = \frac{\partial(u, v)}{\partial(x, y)} = \begin{vmatrix} \frac{\partial u}{\partial x} & \frac{\partial u}{\partial y} \\ \frac{\partial v}{\partial x} & \frac{\partial v}{\partial y} \end{vmatrix} = \begin{vmatrix} \frac{1}{u} & -\frac{v}{u} \\ \frac{v}{x} & \frac{1}{x} \end{vmatrix} = \frac{1}{u} \cdot \frac{1}{x} - \left(-\frac{v}{u}\right) \cdot \frac{v}{x} = \frac{1}{ux} + \frac{v^2}{x} = \frac{1+v^2}{ux}$$

On the right side of the whiteboard:

$$x = u - uv$$

$$y = uv$$

$$\Rightarrow u = x + y$$

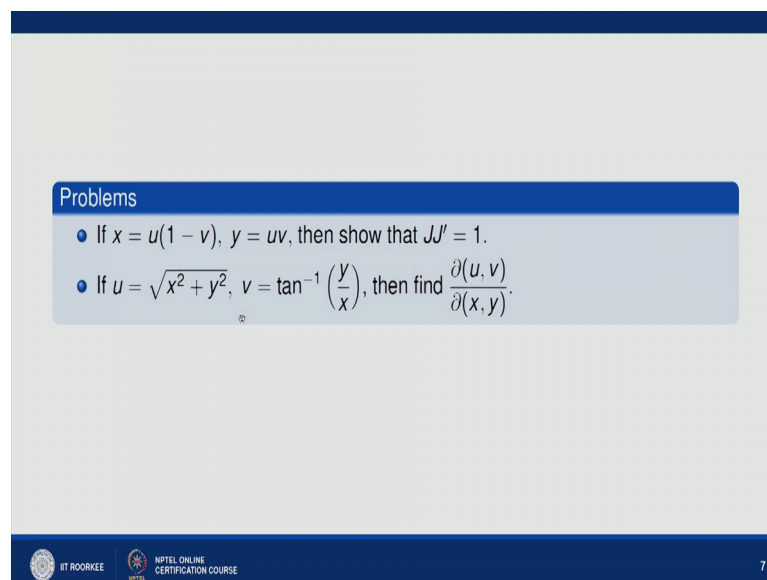

$$v = \frac{y}{u} = \frac{y}{x+y}$$

The first property so, we can easily verify this property, this is x and y is u v . If you compute say if you take J as $\frac{\partial x}{\partial u}$ $\frac{\partial y}{\partial v}$ upon $\frac{\partial u}{\partial u}$ $\frac{\partial v}{\partial v}$. So, it is $\frac{\partial x}{\partial u}$ upon $\frac{\partial u}{\partial u}$ $\frac{\partial y}{\partial v}$ upon $\frac{\partial v}{\partial v}$. So, that we can easily compute ok. Now if you compute J' which is reciprocal of this that is $\frac{\partial u}{\partial x}$ $\frac{\partial v}{\partial y}$ upon $\frac{\partial x}{\partial x}$ $\frac{\partial y}{\partial y}$. It

is $\frac{\partial u}{\partial x}$, $\frac{\partial u}{\partial y}$, $\frac{\partial v}{\partial x}$ and $\frac{\partial v}{\partial y}$. Now first you have to express u and v in terms of x and y . Then only we can compute J' . For J we are having no problem, because J because x and y are already in terms of u and v . So, for finding this expression there is no problem, but for this you have to first express u and v in terms of x and y .

So, what is x ? x is $u - uv$ and y is uv . So, when you add these 2, this implies u is equals to $x + y$. So, u in terms of x and y is $x + y$. And what will be v v is y upon u . So, that is y upon $x + y$ ok. So, we can compute $\frac{\partial u}{\partial x}$ from here $\frac{\partial u}{\partial y}$, $\frac{\partial v}{\partial x}$, $\frac{\partial v}{\partial y}$ from this expression ok. Compute J and J' and we can easily verify that J into J' will come out to be 1 ok.

(Refer Slide Time: 31:14)

Problems

- If $x = u(1 - v)$, $y = uv$, then show that $JJ' = 1$.
- If $u = \sqrt{x^2 + y^2}$, $v = \tan^{-1}\left(\frac{y}{x}\right)$, then find $\frac{\partial(u, v)}{\partial(x, y)}$.

IIT ROORKEE NPTEL ONLINE CERTIFICATION COURSE 7

Now, the next problem. Ah let us try to solve the next problem now.

(Refer Slide Time: 31:20)

The whiteboard shows the following derivations:

$$u = \sqrt{x^2 + y^2}, \quad v = \tan^{-1}\left(\frac{y}{x}\right), \quad \frac{\partial(u, v)}{\partial(x, y)} = ?$$

$$x = r \cos \theta, \quad y = r \sin \theta$$

$$u = r, \quad v = \theta$$

$$\frac{\partial(u, v)}{\partial(r, \theta)} = \begin{vmatrix} \frac{\partial u}{\partial r} & \frac{\partial u}{\partial \theta} \\ \frac{\partial v}{\partial r} & \frac{\partial v}{\partial \theta} \end{vmatrix} = \begin{vmatrix} 1 & 0 \\ 0 & 1 \end{vmatrix} = 1$$

$$\frac{\partial(u, v)}{\partial(x, y)} = \frac{\partial(u, v)}{\partial(r, \theta)} \cdot \frac{\partial(r, \theta)}{\partial(x, y)}$$

$$= 1 \cdot \frac{1}{\sqrt{x^2 + y^2}} = \frac{1}{\sqrt{x^2 + y^2}}$$

$$\frac{\partial(r, \theta)}{\partial(x, y)} = \begin{vmatrix} \frac{\partial r}{\partial x} & \frac{\partial r}{\partial y} \\ \frac{\partial \theta}{\partial x} & \frac{\partial \theta}{\partial y} \end{vmatrix} = \begin{vmatrix} \frac{x}{r} & \frac{y}{r} \\ -\frac{y}{x^2 + y^2} & \frac{x}{x^2 + y^2} \end{vmatrix} = \frac{1}{\sqrt{x^2 + y^2}}$$

Next problem is u is under root x square plus y square and v is tan inverse y by x . And you have to compute $\text{del of } u, v \text{ upon del of } x, y$. So, this we can compute directly also. This is nothing but determinant of $\text{del } u \text{ by del } x, \text{ del } u \text{ by del } y, \text{ del } v \text{ by del } x$ and $\text{del } v \text{ by del } y$. This we can compute directly also. But we can compute this using chain rule also, how? So, let x equal to $r \cos \theta$, and y equal to $r \sin \theta$. So, what will be u , u will be r and v will be θ . And what will be $\text{del of } u, v \text{ upon del of } x, y$, it will be $\text{del of } u, v \text{ upon del of } r, \theta$ into $\text{del of } r, \theta \text{ into del of } x, y$. By the chain rule property of Jacobians.

Now, what is $\text{del } u, v \text{ upon del } r, \theta$, $\text{del } u, v \text{ upon del } r, \theta$ is determinant of $\text{del } u \text{ upon del } r, \text{ del } u \text{ upon del } \theta, \text{ del } v \text{ upon del } r$ and $\text{del } v \text{ upon del } \theta$, which is because u equal to r and v equal to θ , which is $\begin{vmatrix} 1 & 0 \\ 0 & 1 \end{vmatrix}$, and it is 1 ok. Now $\text{del of del of } r, \theta \text{ upon del of } x, y$ is equals to determinant of $\text{del } r \text{ upon del } x, \text{ del } r \text{ upon del } y, \text{ del } \theta \text{ upon del } x$ and $\text{del } \theta \text{ upon del } y$. Which is equal to, which is equals to $\text{del } r \text{ upon del } x$. Now you have to express r in θ in terms of x and y ok. So, what is r ? r is r square is x square by y square. And what is θ , θ is tan inverse y by x .

Basically, we already know that this value this Jacobian is basically r . Let us compute this thing ok. We have a result that $\text{del of } r, \theta \text{ point del of } x, y$ is basically I think 1 by r let us see ok. So, what will be $\text{del } r \text{ upon del } x$ from here it is x by r ok. What is $\text{del } r$ by $\text{del } y$ from here it is y by r . What is $\text{del } y \text{ by del } \theta$ by $\text{del } x$ from here it is 1 upon 1

plus y by x whole square into and it is by with respect to x that is minus y by x square . And del theta by del y is 1 upon 1 plus y by x whole square into 1 by x ok. So, that is x by r y by r and it is minus y by x square plus y square, and it is x upon x square plus y square ok. And this is equal to basically x square basically, 1 by r x square y square can come out. And it is x square plus y square, that cancel out and it is 1 by r yeah.

So, it is 1 by r basically it is a result basically that del of r theta upon del of x y is 1 by r. We can use it directly also. So, so now, what will be this expression? This expression it is one it is 1 by r. So, it is 1 by r and r is under root x square plus y square. So, we can solve such problems using chain rule also ok. Now, similarly if we have function of 3 unknowns. Then also we can convert using change of variable.

(Refer Slide Time: 35:45)

Continued...

Similarly, if $f(x, y, z)$ is a differentiable function of x, y and z , where $x = \psi_1(u, v, w)$, $y = \psi_2(u, v, w)$ and $z = \psi_3(u, v, w)$, then

$$\frac{\partial f}{\partial x} = \frac{1}{J} \left(\frac{\partial(f, y, z)}{\partial(u, v, w)} \right)$$

$$\frac{\partial f}{\partial y} = -\frac{1}{J} \left(\frac{\partial(f, x, z)}{\partial(u, v, w)} \right)$$

$$\frac{\partial f}{\partial z} = \frac{1}{J} \left(\frac{\partial(f, x, y)}{\partial(u, v, w)} \right),$$

$$J = \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} & \frac{\partial x}{\partial w} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} & \frac{\partial y}{\partial w} \\ \frac{\partial z}{\partial u} & \frac{\partial z}{\partial v} & \frac{\partial z}{\partial w} \end{vmatrix}$$

 IIT ROORKEE
  NPTEL ONLINE CERTIFICATION COURSE

8

So, f x we can obtain as 1 by J times del of f y z upon del of u v w. Similarly, del f upon del y and del f upon del z; where J is simply del of x y z upon del of u v w.

Now, let us let us try to solve the first problem is easy you can easily solve the first problem. Let us try to solve the second problem, now the second problem u is x square plus y square plus z square.

(Refer Slide Time: 36:17)

$$u = x^2 + y^2 + z^2$$

$$v = xy + yz + zx$$

$$w = x + y + z$$

$$w^2 = u + 2v$$

$$\frac{\partial(u, v, w)}{\partial(x, y, z)} = \begin{vmatrix} \frac{\partial u}{\partial x} & \frac{\partial u}{\partial y} & \frac{\partial u}{\partial z} \\ \frac{\partial v}{\partial x} & \frac{\partial v}{\partial y} & \frac{\partial v}{\partial z} \\ \frac{\partial w}{\partial x} & \frac{\partial w}{\partial y} & \frac{\partial w}{\partial z} \end{vmatrix} = \begin{vmatrix} 2x & 2y & 2z \\ y+z & z+x & x+y \\ 1 & 1 & 1 \end{vmatrix}$$

$$= 2x(z+x-y) - 2y(y+z-x) + 2z(y+z-x-x)$$

$$= 0$$

And v is $x \times y$ plus $y \times z$ plus $z \times x$, w is x plus y plus z . And you have to compute del of u w upon del of $x \ y \ z$. So, what will be this Jacobean this is del of u upon del of x del u upon del y del u upon del z , del v upon del x del v upon del y del v upon del z . Again, del w upon del x del w upon del y del w upon del z , and it is equal to what is del u upon del x ? $2 \times 2 \ y \ 2 \ z$, it is del del v upon del x it is y plus z . It is 2 it is z plus x it is x plus y , and it is $1 \ 1 \ 1$ ok.

Now, when you simplify this. So, we get $2 \times$ times z plus x minus x minus y minus $2 \ y$ times y plus z minus x minus y , and it is plus $2 \ z$ times y plus z minus z minus x . So, when you simplify this. This will cancel out. When you simplify this, you will get 0 . So, Jacobean of this is 0 .

Now Jacobean comes out to be 0 , what does it mean? It means that these relations of $u \ v$ and w are not are not independent, they are dependent ok. And what is the relation? Relation you can easily verify. You very easily see that w square is equal to basically u plus $2 \ v$. So, these are relation. That is why Jacobean is coming out to be 0 ok. So, this is all about change of variables.

So, thank you very much.
