Lecture – 18
Inner Product Spaces

Hello friends, welcome to lecture series on Matrix Analysis with Applications. Our today's lecture is based on inner product. What inner product is and how we will see some important properties of inner product also.

(Refer Slide Time: 00:38)

Definition

Let F be the field of real numbers or the field of complex numbers and V be a vector space over F .

An inner product on a vector space V is a function $\langle, \rangle: V \times V \rightarrow F$ satisfying the following properties: For all $x, y, z \in V$ and for all $\alpha \in F$,

- 1 $\langle x, x \rangle \geq 0$ and $\langle x, x \rangle = 0$ if and only if $x = 0$,
- 2 $\langle x, y \rangle = \overline{\langle y, x \rangle}$, (bar is denoting the complex conjugation),
- 3 $\langle x + z, y \rangle = \langle x, y \rangle + \langle z, y \rangle$,
- 4 $\langle \alpha x, y \rangle = \alpha \langle x, y \rangle$,

(V, \langle, \rangle) is called an inner product space. We may say V is an inner product space explicitly mentioning the inner product \langle, \rangle .

IIT ROORKEE NPTEL ONLINE CERTIFICATION COURSE 2

So, what are inner product let us see. So, let F be a field of real numbers or the field of complex numbers and V be a vector space over F . An inner product on the vector space V is a function which is denoted by this from V cross V to F satisfying the following properties. So, these are the four properties which have at inner product must be must hold for every x, y, z in V and for every alpha in field. So, what are these four properties let us see.

(Refer Slide Time: 01:18)

$$\begin{aligned}
 1. \quad & \langle x, x \rangle \geq 0 \quad \& \quad \langle x, x \rangle = 0 \iff x=0. \\
 2. \quad & \langle x, y \rangle = \overline{\langle y, x \rangle} \\
 3. \quad & \langle x+y, z \rangle = \langle x, z \rangle + \langle y, z \rangle \\
 4. \quad & \langle \alpha x, y \rangle = \alpha \langle x, y \rangle.
 \end{aligned}$$

$\langle \cdot, \cdot \rangle: V \times V \rightarrow F$

$$\begin{aligned}
 \langle x, \alpha y \rangle &= \overline{\langle \alpha y, x \rangle} = \overline{\alpha \langle y, x \rangle} \\
 &= \overline{\alpha} \overline{\langle y, x \rangle} \\
 &= \overline{\alpha} \langle x, y \rangle.
 \end{aligned}$$

The first property is the first property is inner product of x cross x is always greater than equal to 0; and it is equal to 0 if and only if x is equal to 0 is a first property. The second property is inner product of x and y is equal to inner product of y and x whole bar, where bar is a complex conjugate. The third one is inner product of x plus y comma z is same as inner product of x, z plus inner product of y, z. And the four property is the four property is inner product of inner product of alpha x comma y is same as inner alpha times inner product of x comma y where alpha is any scalar in field.

So, if you have a function in which is defined like this from V cross V to F satisfying these four properties then that product is called inner product. And that vector space defined in which this inner product is defined is called inner product space.

Now, one important property which can be seen from the four property you see if you take inner product of x comma alpha y so that will be equal to inner product of alpha y comma x whole bar by second property. So, this can be written as using this property, this can be written as alpha time inner product of y x whole bar which is equals to alpha bar inner product of y comma x whole bar. And this is alpha bar. And the inner product the complex conjugate of this from the second property is equals to inner product of x comma y. So, if this scalar is in the second with the second component, then it is alpha bar; and if it is a first component, then it is alpha.

(Refer Slide Time: 03:25)

Examples

- The dot product or scalar product in $\mathbb{R}^n(\mathbb{R})$ defined as

$$\langle u, v \rangle = \sum_{i=1}^n a_i b_i$$

is an inner product, where $u = (a_1, a_2, \dots, a_n)$ and $v = (b_1, b_2, \dots, b_n) \in \mathbb{R}^n$.

- The standard complex inner product of two vectors in $\mathbb{C}^n(\mathbb{C})$ defined as

$$\langle u, v \rangle = \sum_{i=1}^n u_i \bar{v}_i$$

is an inner product, where $u = (u_1, u_2, \dots, u_n)$ and $v = (v_1, v_2, \dots, v_n) \in \mathbb{C}^n$.

Now, let us discuss first few examples based on this. The first example is the dot product in \mathbb{R}^n . If we define a dot product in \mathbb{R}^n which is defined as this then this is an inner product space defines the inner product. Let us see how.

(Refer Slide Time: 03:41)

$$V = \mathbb{R}^n, F = \mathbb{R}, \quad u = (a_1, a_2, \dots, a_n), \quad v = (b_1, b_2, \dots, b_n)$$

$$\langle u, v \rangle = \sum_{i=1}^n a_i b_i$$

- $$\langle u, u \rangle = \sum_{i=1}^n a_i a_i = \sum_{i=1}^n a_i^2 = a_1^2 + \dots + a_n^2 \geq 0$$

$$\langle u, u \rangle = 0 \Rightarrow a_1^2 + \dots + a_n^2 = 0 \Rightarrow a_i = 0 \quad \forall i$$

$$\Rightarrow u = 0$$

$$u = 0 \Rightarrow \langle 0, 0 \rangle = 0$$
- $$\langle u, v \rangle = a_1 b_1 + \dots + a_n b_n = b_1 a_1 + b_2 a_2 + \dots + b_n a_n = \langle v, u \rangle$$
- $$\langle u+v, w \rangle = \sum_{i=1}^n (a_i + b_i) c_i$$

$$= \sum_{i=1}^n a_i c_i + \sum_{i=1}^n b_i c_i = \langle u, w \rangle + \langle v, w \rangle$$

$w = (c_1, \dots, c_n)$
- $$\langle \alpha u, v \rangle = \sum_{i=1}^n (\alpha a_i) b_i = \alpha \sum_{i=1}^n a_i b_i = \alpha \langle u, v \rangle$$

You see you are taking V as \mathbb{R}^n and field as \mathbb{R} ok. And if you take u as a_1, a_2, \dots, a_n and v as b_1, b_2, \dots, b_n , then the inner product of u and v is simply summation of $a_i b_i$, i from 1 to n . Now, this can easily be shown you see. The first property is inner product of u comma u . What are inner product u comma u , it is summation i from 1 to n a_i into a_i

$\sum_{i=1}^n a_i^2$, which is simply summation $\sum_{i=1}^n a_i^2$ or $a_1^2 + a_2^2 + \dots + a_n^2$ and that is always greater than equal to 0.

And this inner product is equal to 0 if and only if you see if it is equal to 0, this implies $\sum_{i=1}^n a_i^2 = 0$. And this implies $a_i = 0$ for all i ; $a_i = 0$ for all i . And this means $u = 0$. And of course, if $u = 0$, then this implies inner product of 0 comma 0 is of course 0 by this definition. So, the first property holds.

Now, for second property you can see inner product of u comma v if you write it is $a_1 b_1 + a_2 b_2 + \dots + a_n b_n$, this can be written as $b_1 a_1 + b_2 a_2 + \dots + b_n a_n$. So, this is same as inner product of v comma u , because we are talking in real space I mean real field is a real vector space so bar is itself.

Now, the third property is third property is inner product of u comma v comma u plus v comma w is equals to you can see if you if you take w as $c_1 u + c_2 v + \dots + c_n u$ then this will be equals to summation $\sum_{i=1}^n (a_i b_i + b_i c_i)$ by this definition which is summation over i $a_i c_i + b_i c_i$. And this is equal to inner product of u and w plus inner product of v and w . So, third property also holds.

Now, the fourth property is inner product of αu comma v is equal to this is summation $\sum_{i=1}^n \alpha a_i b_i$. So, it is $\alpha \sum_{i=1}^n a_i b_i$ as you can already see. And this is equals to α times summation $\sum_{i=1}^n a_i b_i$ which is equal to α times inner product of u comma v . So, hence we have seen that all the four properties hold over this definition when we define the inner product by this. All the four properties hold. So, this defines inner product. And the vector space over which this inner product is defined we are calling that vector space as inner product space.

So, there may be some other ways also to define the inner product over \mathbb{R}^n , this is this is one of the way we are defining the inner product between u and v . Now, if you take \mathbb{C}^n I mean vector space as \mathbb{C}^n over the complex field then the inner product may be defined like this. This is again formed an inner product this can easily be verified.

(Refer Slide Time: 07:38)

$$\begin{aligned}
 & V = \mathbb{C}^n, \quad F = \mathbb{C} \qquad u = (u_1, u_2, \dots, u_n) \\
 & \qquad \qquad \qquad \qquad \qquad \qquad v = (v_1, v_2, \dots, v_n) \\
 & \langle u, v \rangle = \sum_{i=1}^n u_i \bar{v}_i \\
 1. \quad & \langle u, u \rangle = \sum_{i=1}^n u_i \bar{u}_i = \sum_{i=1}^n |u_i|^2 = |u_1|^2 + \dots + |u_n|^2 \geq 0 \\
 & \langle u, u \rangle = 0 \Rightarrow |u_1|^2 + \dots + |u_n|^2 = 0 \Rightarrow |u_i| = 0 \quad \forall i \Rightarrow u_i = 0 \quad \forall i \\
 & \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \Rightarrow u = 0 \\
 & u = 0 \Rightarrow \langle 0, 0 \rangle = 0. \\
 2. \quad & \langle u, v \rangle = \sum_{i=1}^n u_i \bar{v}_i = \sum_{i=1}^n v_i \bar{u}_i = \overline{\sum_{i=1}^n v_i \bar{u}_i} = \overline{\langle v, u \rangle} \\
 3. \quad & \langle u+v, w \rangle = \sum_{i=1}^n (u_i + v_i) \bar{w}_i = \sum_{i=1}^n u_i \bar{w}_i + \sum_{i=1}^n v_i \bar{w}_i \qquad w = (w_1, \dots, w_n) \\
 & \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad = \langle u, w \rangle + \langle v, w \rangle \\
 4. \quad & \langle \alpha u, w \rangle = \sum_{i=1}^n (\alpha u_i) \bar{w}_i \\
 & \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad = \alpha \sum_{i=1}^n u_i \bar{w}_i = \alpha \langle u, w \rangle.
 \end{aligned}$$

You see we are taking V as \mathbb{C}^n and field as \mathbb{C} . Now, inner product of u and v for any $u, v \in \mathbb{C}^n$ is defined like this i from 1 to n ; it is u_i 's v_i 's bar conjugate of this. We are taking u as u_1, u_2, \dots, u_n and v as v_1, v_2, \dots, v_n .

So, the first property is that inner product of u and u is equal to summation over i u_i into u_i bar which is summation over i mod of u_i squares. This means mod of u_1 square plus mod of u_2 square and so on up to mod of u_n square. So, this is always greater than equal to 0 for all u . Now, if this is equal to 0 this implies mod of u_1 square plus and so on mod of u_n is equal to 0 and this implies mod of u_n is equal to 0 for all i and this implies u_i equal to 0 for all i and; that means, u equal to 0. Now, if u equal to 0 of course, inner product of 0 and 0 is 0 so, the first property holds.

Now, for second property inner product of u and v if you take is summation i from 1 to n $u_i v_i$ bar which can be written as summation i from 1 to n $v_i u_i$ bar whole bar. And this is inner product of v and u whole bar. So, second property also holds.

Now, the third property is summation inner product of u plus v and w that is equal to summation u_i plus v_i into w_i bar over i where we are taking w as w_1 up to w_n . So, this is summation over i $u_i w_i$ bar plus summation over i $v_i w_i$ bar; and this is inner product of u and w plus inner product of v and w .

The fourth property is inner product of αu and w is equals to summation over i αu_i into w_i bar which is equals to α times summation over i $u_i w_i$ bar, which is α times inner product of u and w . So, we have shown all the four properties over this definition that means, this defines an inner product over the over the complex over C^n over the complex field.

(Refer Slide Time: 10:39)

Continued...

- Consider the vector space $C[a, b]$ (the space of all real continuous functions on the closed interval $[a, b]$). The following defines an inner product on $C[a, b]$, where $f(t)$ and $g(t)$ are real functions in $C[a, b]$:

$$\langle f, g \rangle = \int_a^b f(t)g(t)dt.$$
- Let $M = M_{m \times n}$ the vector space of all $m \times n$ real matrices. An inner product is defined on M by

$$\langle A, B \rangle = \text{tr}(B^T A) = \sum_{i=1}^m \sum_{j=1}^n a_{ij}b_{ij}$$

where $\text{tr}(\cdot)$ is the trace and $A = [a_{ij}]$ and $B = [b_{ij}]$

IIT ROORKEE

NPTL ONLINE
CERTIFICATION COURSE
4

Now, similarly we can go for the third problem that if we define a vector space, if we define if we take a vector space of all real continuous functions on the interval on the close interval a to b , and we defined as the product as integral a to b $f(t)g(t)dt$ then this defines an inner product very easy to show. Because you can simply see that if you take f and f inner product f and f then which is simply $\int_a^b f^2 dt$ which is always greater than equal to 0 for every f . And if $\int_a^b f^2 dt = 0$ that means, $\int_a^b f^2 dt = 0$ and that is true only when $f = 0$. So, the first property holds.

Now, when you take inner product of f and g or g or f both are same because $\int_a^b f(t)g(t)dt$ is same as $\int_a^b g(t)f(t)dt$. Now, inner product of $f+g$ comma h if you take $f+g$ into h so that property the third property can be directly obtained. And α times f comma g is you can simply take α outside the integration. And we can get the four property also. So, these definitions define inner product on the vector space C of close interval a to b . Now, if you take this example, we considered all the matrixes all the real matrices of

order m cross n over the real field, and this defines the inner product. How it is defined inner product let us see.

(Refer Slide Time: 12:24)

$$\begin{aligned}
 V &= M_{m \times n}, F = \mathbb{R} \\
 \langle A, B \rangle &= \text{trace}(B^T A) = \sum_i \sum_j a_{ij} b_{ij} \\
 - \langle A, A \rangle &= \text{trace}(A^T A) = \sum_i \sum_j a_{ij}^2 \geq 0 \\
 \langle A, A \rangle = 0 &\Rightarrow \sum_i \sum_j a_{ij}^2 = 0 \Rightarrow a_{ij} = 0 \forall i \& j \Rightarrow A = 0 \\
 A = 0, \langle 0, 0 \rangle &= 0 \\
 - \langle A, B \rangle &= \text{trace}(B^T A) = \sum_i \sum_j a_{ij} b_{ij} = \sum_i \sum_j b_{ij} a_{ij} \\
 &= \text{trace}(A^T B) \\
 &= \langle B, A \rangle \\
 - \langle A+B, C \rangle &= \text{trace}(C^T (A+B)) \\
 &= \text{trace}(C^T A + C^T B) \\
 &= \text{trace}(C^T A) + \text{trace}(C^T B) \\
 &= \langle A, C \rangle + \langle B, C \rangle \\
 - \langle \alpha A, B \rangle &= \text{trace}(B^T (\alpha A)) = \sum_i \sum_j (\alpha a_{ij}) b_{ij} = \alpha \sum_i \sum_j a_{ij} b_{ij} = \alpha \text{trace}(B^T A) \\
 &= \alpha \langle A, B \rangle
 \end{aligned}$$

So, here we are taking vector space as all matrix of order m cross real matrix of order m cross n and field as real. And inner product between matrices A and B we are defined as trace of trace of B transpose A which is simply summation over i summation over j $a_{ij} b_{ij}$. Now, the first property is that inner product of A and A inner product of A and A means trace of A transpose A which is which means summation over i summation over j a_{ij}^2 whole square that is always greater equal to 0 of course, because some of non negative quantities.

Now, inner product of A comma A is equal to 0 implies summation i summation j a_{ij}^2 whole square equal to 0 and that is true only when a_{ij} equal to 0 for all i and j and that means matrix A itself is 0. And again if matrix A is 0 the definition trivially holds because it is inner product of 0 and 0 that means, trace of 0 transpose 0 which is of course, 0. So, the first property holds.

Now, if I take the second property that is A and B which is same as trace of B transpose A which is given by a summation i summation j $a_{ij} b_{ij}$ if we this can be written as summation over i summation over j $b_{ij} a_{ij}$. So, we can easily write with a trace of A transpose B which is inner product of B and A .

Now, a third property is inner product of A plus B and C which is same as trace of trace of C transpose A plus B by the definition which is trace of C transpose A plus C transpose B. And this can be written as by the property of trace the trace of C transpose A plus trace of C transpose B, which is inner product of C and with inner product of a and c sorry a and c and the plus inner product of b and c. So, third property also holds.

Now, for the last property it is trace of inner product of alpha A comma B is equals to trace of B transpose alpha A which can be written as summation over i summation over j here a will we will replace a i j by alpha times a i j. So, alpha times a i j because all you are multiplying A with alpha. So, it is b i j. This can be written as alpha times summation over i summation over j a i j b i j. And this will be alpha times trace of B transpose A or alpha times inner product of A and B. So, hence we can say that all the four properties holds over this definition that means, this defines an inner product for this vector space over this field. So, these are the few examples of inner product.

(Refer Slide Time: 15:57)

Orthogonality

Let V be an inner product space. The vectors $u, v \in V$ are said to be **orthogonal** and u is said to be **orthogonal** to v if

$$\langle u, v \rangle = 0$$

Problems

- Consider the vectors $u = (1, 1, 1), v = (1, 2, -3), w = (1, -4, 3)$ in \mathbb{R}^3 . (a). Is u orthogonal to v and w ? (b). Is v orthogonal to w ?
- Find a nonzero vector w that is orthogonal to $u_1 = (1, 2, 1)$ and $u_2 = (2, 5, 4)$ in \mathbb{R}^3 .

IT ROORKEE NPTEL ONLINE CERTIFICATION COURSE 5

Now, when we can say that two vectors are orthogonal, so two vectors are said to be orthogonal if the inner product of between them is 0. Then we say that u and v are orthogonal. Now, let us see this problem consider vectors u equal to this v and w . So, the first problem is u orthogonal to v and w . So, you see here we are defining inner product as a standard inner product that may a dot product. If nothing is given that means we are taking the inner product as the dot product of the two vectors.

So, what a dot product of u and v it is 1 plus 2 is 3 minus 3 is 0 that means, u is orthogonal to v it is clear. Now, is u is orthogonal w also. So, let us see; 1 into 1 is 1; 1 minus 4 minus 4; 1 minus 4 is minus 3 plus 3 is 0. So, yes, it is orthogonal to w also. So, the first part the also the first part is yes.

Now, is v orthogonal w ? So, to see that v is orthogonal to w try to find out the inner product of v and w ; and if it is equal to 0; that means v is orthogonal to w . So, see here 1 into 1 is 1; 2 into minus 4 is minus 8; and 3 into minus 3 is minus 9, it is not equal to 0 clearly. So, v is not orthogonal to w . Now, find a nonzero vector w that is orthogonal to u_1 and also u_2 .

(Refer Slide Time: 17:47)

$$\begin{aligned}
 u_1 &= (1, 2, 1), \quad u_2 = (2, 5, 4) \quad w \neq 0 \\
 w &= \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ 1 & 2 & 1 \\ 2 & 5 & 4 \end{vmatrix} & \begin{aligned} &w \perp u_1 \\ &\text{and } w \perp u_2 \\ &\langle w, u_1 \rangle = \langle w, u_2 \rangle \\ &= 0 \end{aligned} \\
 &= \hat{i}(3) - \hat{j}(2) + \hat{k}(1) \\
 w &= (3, -2, 1) \\
 \left. \begin{aligned} \langle w, u_1 \rangle &= 3 - 4 + 1 = 0 \\ \langle w, u_2 \rangle &= 6 - 10 + 4 = 0 \end{aligned} \right\}
 \end{aligned}$$

So, what is u_1 and what is u_2 . Here u_1 is it is 1, 2, 1; and u_2 is it is 2, 5, 4. So, we have to find a nonzero vector w which is orthogonal to w is orthogonal to u_1 and w is orthogonal to u_2 also that means the inner product of w and u_1 and inner product of w and u_2 is equal to 0. So, so a vector which is orthogonal to these two vector is simply the cross product of these two. You simply find the cross product of these two that is will be a w which is orthogonal to these two vectors. So, how to find w , so w will be simply you find the cross product of these two cross product of these two will be $i \ j \ k$, it is 1 2 1 2 5 4. So, it is i cap times 8 minus 5 is 3 minus j cap time it is 4 minus 2 is 2 plus k cap times it is 1.

So, we can say that w is simply $3i - 2j + k$. You can check also you see $3i - 2j + k$ into if you take the inner product of w and u_1 . So, what are the inner product it is $3 - 4 + 1$ which is 0 . Inner product of w and u_2 is $6 - 10 + 4$ which is again 0 of course, it will be because it is the cross product of these two vectors and hence w will be orthogonal to these two vectors. Or though other way out is in fact in fact any alpha time this vector $3i - 2j + k$ will be orthogonal to u_1 and u_2 both. Now, how you define orthogonal complements.

(Refer Slide Time: 19:39)

Orthogonal Complements

Let S be a subset of an inner product space V . The orthogonal complement of S , denoted by S^\perp consists of those vectors in V that are orthogonal to every vector $u \in S$; i.e.,

$$S^\perp = \{v \in V : \langle v, u \rangle = 0 \ \forall u \in S\}$$

In particular, for a given vector $u \in V$, we have

$$u^\perp = \{v \in V : \langle v, u \rangle = 0\}$$

Theorem

Let S be a subset of a vector space V . Then S^\perp is a subspace of V .

NPTEL ONLINE CERTIFICATION COURSE

6

Let S be a subset of an inner product space V the orthogonal complement of S denoted by S^\perp consists of all those vectors in V that are orthogonal to every vector u belongs to S . u is a subset of inner product space V . So, this is a orthogonal compliment of S which is given by all those v in V such that inner product of v and u is 0 for every u in S . In particular, for a given vector u belongs to V , we have orthogonal compliment of u as that V which is orthogonal to u collection of all those V which is orthogonal to u . Now, the first property of this orthogonal compliment is that it is a subspace of V .

(Refer Slide Time: 20:37)

$$\begin{aligned}
 S \subseteq V \quad S^\perp \subseteq V, \quad S^\perp &= \{ v \in V \mid \langle v, u \rangle = 0, \forall u \in S \} \\
 \text{Let } v_1, v_2 \in S^\perp, \quad \alpha \in F \quad \alpha v_1 + v_2 &\in S^\perp \\
 \text{for any } u \in S, & \quad \uparrow \\
 & \quad \text{To Prove} \\
 \langle \alpha v_1 + v_2, u \rangle & \\
 &= \langle \alpha v_1, u \rangle + \langle v_2, u \rangle \\
 &= \alpha \langle v_1, u \rangle + \langle v_2, u \rangle \\
 &= 0 \\
 \Rightarrow \alpha v_1 + v_2 \in S^\perp &\Rightarrow S^\perp \text{ is a subspace of } V.
 \end{aligned}$$

So, how we define orthogonal complement orthogonal compliment is basically a subset of vector space V which is defined as all those v in V such that inner product of v and u is equal to 0 for all u in S S is a subset of V . Now, in order to show that this is a subspace of this vector space V let v_1, v_2 in S orthogonal compliment and α belongs to field. And we have to show that $\alpha v_1 + v_2$ also belongs to S complement. This to prove to show that it is a it is a subspace we have to show that this also belongs to orthogonal compliment of S .

So, how we will show this? So, let us try to find out the inner product of this with any u , any u in s for any u in s . Now, this is equals to by the definition of inner product, this is this u plus v_2 comma v_2 comma u . Again this is α times inner product of v_1 u plus inner product of v_2 u . Now, since u, v_1 and v_2 are in orthogonal compliment of S , so this is 0 and this is 0 for any u . So, this is equal to 0. So, we have shown that $\alpha v_1 + v_2$ belongs to orthogonal complement of s and that means orthogonal complement of S is a subspace of S of V .

(Refer Slide Time: 22:25)

Some Geometrical Interpretations

- Suppose u is a nonzero vector in \mathbb{R}^3 . Then u^\perp is the plane in \mathbb{R}^3 through the origin O and perpendicular to the vector u .
- Let W be the solution space of an $m \times n$ homogeneous system $AX = 0$, where $A = [a_{ij}]$ and $X = [x_i]$, then each solution vector $w = (x_1, x_2, \dots, x_n)$ is orthogonal to each row of A and hence W (the kernel space of the linear mapping $A : \mathbb{R}^n \rightarrow \mathbb{R}^m$) is the orthogonal complement of the row space of A .

IT ROORKEE NPTEL ONLINE CERTIFICATION COURSE 7

Now, we have few geometric interpretations of a complement orthogonal complement. Suppose that u is a nonzero vectors in \mathbb{R}^3 then orthogonal complement of a vector u is a plane in \mathbb{R}^3 passing through origin and is perpendicular to the vector u . You see what is what is an orthogonal compliment orthogonal compliment of element are all those V in V such that orthogonal.

(Refer Slide Time: 22:53)

$$u^\perp = \{ v \in V \mid \langle v, u \rangle = 0 \}$$
$$AX = \begin{pmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1} & a_{m2} & \dots & a_{mn} \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ \vdots \\ 0 \end{pmatrix}$$

Ah inner product of v and u is equal to 0 is equal to 0. So, how we can how we can see geometry geometrically. So, geometrically it is simply it is simply all the planes it is

something like plane you see we have to find out V . All the planes which are passing through origin because it is equal to 0 and perpendicular to u it is very clear from the definition itself.

Now, now let the second one is let W be a solution of a space of an m cross n homogeneous system of equations $AX = 0$. Suppose, for this equation for this system equations the solution space is W ok, where A is a matrix a_{ij} and X is a column vector x_i . Then each solution w which is given by x_1, x_2 up to x_n is orthogonal to each row of a and hence w the kernel space of the linear mapping a from \mathbb{R}^n to \mathbb{R}^m is the orthogonal complement of the row space of A . You see here we have matrix of order m cross n and x is a column vector of order n cross 1.

You see here we are having A into X A is a matrix $a_{11} a_{12}$ and so on up to a_{1n} . Similarly, $a_{n1} a_{n2}$ and $a_{m1} a_{m2} a_{mn}$ and here it is $x_1 x_2$ up to x_n equal to it is 0 0 0. What does this mean this means that when you multiply this row with this column it is equal to 0. The second row with this column is equal to 0; the third row with this column is equal to 0. So, what does it mean this means that that every row every row is orthogonal to this that is that is what is it is here that each solution each solution is orthogonal to each row because the inner product of row and the x_i is 0.

So, each solution is orthogonal to each row and hence W is orthogonal complement of the row space of A . So, this W which is a solution space of this is simply the orthogonal complement of row space of A , row space is a space generated by the rows of A . So, this is all about inner product space. So, in this lecture, we have seen that what inner product space is and what are the properties of inner product. We have also seen that if a set is known to you then how we can find out orthogonal complement of that S .

Thank you.
