Lecture – 07
Subspaces

Hello friends, welcome to lecture series on Matrix Analysis with Applications. So, in this lecture, we will talk about Subspaces. In the last lecture, we have seen that what vector spaces are, and how can we see that a given set is a vector-space or not, over a over a given real field ok, real or complex field.

(Refer Slide Time: 00:49)

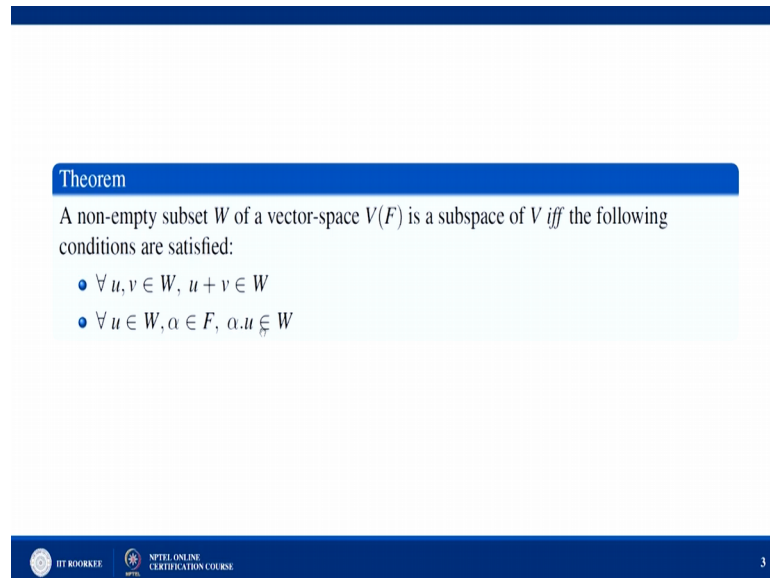

The slide features a blue header bar with the title "Subspaces". Below the header, the text defines a subspace: "Let V be a vector space over a field F and let $W \subseteq V$. Then W is called a *subspace* of V if W itself is a vector space over F with respect to the operations of vector addition and scalar multiplication on V ." A second paragraph states: "In any vector-space V , V and $\{0\}$ are subspaces (also called trivial subspaces of V). The subspace $\{0\}$ is called the 'zero subspace' of V ." At the bottom of the slide, there are logos for IIT Roorkee and NPTEL Online Certification Course, along with a page number "2".

So, what subspaces are. Let us see. Let V be a vector-space over the field F , and let W be a subset of V ok; this V is a vector-space over the field F , and this W is a subset of this V . Then this V this W is called subspace of V , if W itself is a vector-space over the field F with respect to the same operations of vector addition and scalar multiplication on V . Whatever scalar, whatever vector addition and scalar multiplication is in V over F , the same vector the same vector addition scalar multiplication we apply on W , which is a subset of V . If it is itself vector-space of the same field F , then we say that is a subspace of V .

So, in any vector-space V , two subspaces are trivial, the first one is V itself ok, because V is a subset of V , and it is a vector-space. And this 0 subspace, which is a trivial subspace

of trivial subspaces of vector spaces V . The subspace this 0 , this 0 is simply additive identity you see, and is also called ‘zero subspace’ of V . So, if a set is given to you ok, if a subset of a vector-space V is given to you, and if this W itself is a vector-space over the same field F , with respect to the same set of vector additions and scalar multiplication that we say that W is a subspace over vector-space V .

(Refer Slide Time: 02:43)

Theorem

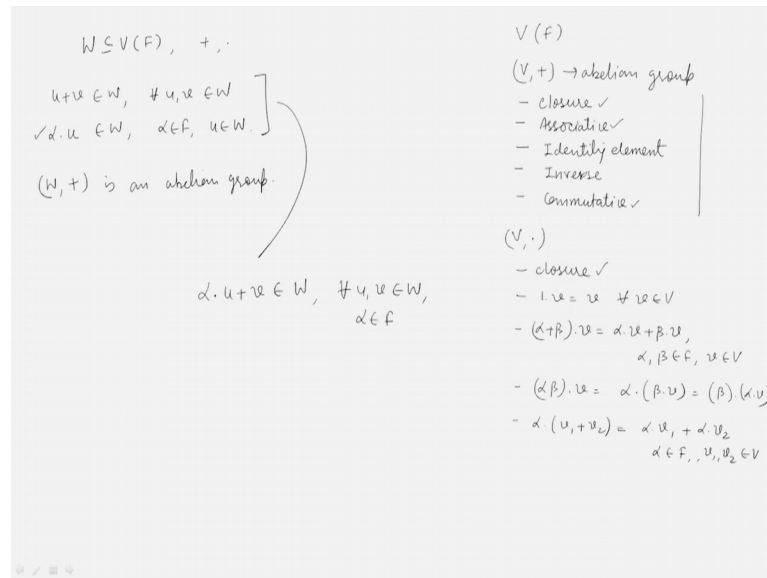

A non-empty subset W of a vector-space $V(F)$ is a subspace of V iff the following conditions are satisfied:

- $\forall u, v \in W, u + v \in W$
- $\forall u \in W, \alpha \in F, \alpha \cdot u \in W$

IT ROORKEE NITEL ONLINE CERTIFICATION COURSE 3

Now, how can we show that a given a subset W of V is a subspace. So, instead of showing all the properties of a vector-space V , if we show these two properties that is closure respect to addition vector addition, and closure with respect to a scalar multiplication, then it is sufficient to show that that W is a subspace of this vector-space V .

(Refer Slide Time: 02:59)

Now, how can we say this, you see. You see that we say that V is a vector-space over the field F if V with respect to plus is an Abelian group. Abelian group means, first is closure, next is associative ok, then identity element, then inverse element ok, and then commutative. If these property holds this with respect to addition vector addition, then we say that V with respect to addition is the Abelian group.

And with respect to dot, the first is closure, the second property is $1 \cdot V$ is equal to V for all V in V ok, third property is $\alpha + \beta$ dot with V is equals to α dot V plus β dot V , where α, β are in field, and V is any vector in V . Next is $\alpha \beta$ dot V is equals to α dot β dot V ok, and same as β ; β dot α dot V . And next is α dot $V_1 + V_2$ is must be equals to α dot V_1 plus α dot V_2 for all α in field, and for all V_1, V_2 in vector space V .

So, if this property hold with respect to addition and scalar multiplication, then we say that V is a vector-space over the field F . Now, now we are taking W as a sub set of V , over the same field F with respect to same vector addition in scalar multiplication. Now, now you see you see if you say these closure, closure is a automatically, because of this property, the first property itself says that it is close with respect to vector addition ok.

Now, the second property is associative. Since, associative holds for every element u, v, w in V , so it will hold for a subset of V also. Now, we have to show the existence of identity element, and inverse with respect to addition. Now, we know that u plus v

belongs to w , for all u, v belongs to w . And $\alpha \cdot u$ belongs to w , for all α belongs to field, and u belongs to w .

Now, if you take α equal to 0, say for example, because it holds for every α , so it will hold for α equal to 0 also. And $0 \cdot u$ is nothing but I did not expect to addition, so that means, 0 belongs to w , so, we have shown that existence of identity element with respect to addition. Now, for inverse, you simply you simply replace you simply replace α by minus 1. So, $-1 \cdot u$ is $-u$, we have already shown, so that means, inverse element with respect to addition also exist.

Now, commutativity property holds, because this property holds for every u, v in v , so it will hold for a subset also, because subset elements of w are nothing but the elements of v . And this v holds commutative property for every u, v in v , so it will hold for subset also. So, so we can say that w with respect to plus is an Abelian group.

Now, we have to show with respect to dot. Now, with respect to dot closure is automatically satisfied, because of the second property. Now, $1 \cdot v$ is v , because it is it is now this property is holding for every α ok. You see, you see this property is holding for every v in v , so it will hold for a subset also. So, we can say that this property hold. And similarly, all the remaining three properties also hold for w , because w is a subset of v .

So, hence, we can say that if we show the these two properties, then we can say that w is a subspace of v , or we can club these two properties as we can club these properties to property $\alpha \cdot u + v$ should belong to w for all u, v in w , and α in F . So, either we have two ways to show that W is a subspace of vector-space V , either we show these two properties separately, or we can show the single property, and we can show that, then we can say that W is a subspace of a vector-space V .

(Refer Slide Time: 08:23)

Examples of subspaces

- Let $V = \mathbb{R}^2(\mathbb{R})$ and $W = \{(x, y) \in \mathbb{R}^2 : x + 2y = 0\}$
Then W is the subspace of V .
- Let $V = M_{n \times n}(\mathbb{R})$ and $W = \{A \in M_{n \times n} : A = A^T\}$
Then W is the subspace of V .
- Let $V = P_2(\mathbb{R})$. Then $W = \{a_0x^2 + a_1x + a_2 \in P_2 : a_0 + a_1 = 0\}$ is the subspace of V .
- Let V be the (real) vector-space of all functions f from \mathbb{R} into \mathbb{R} . Then $W = \{f \in V : f(-1) = 0\}$ is the subspace of V .
- Let $V = M_{n \times 1}(F)$. Suppose A be an $m \times n$ matrix over F . Then the set of all $n \times 1$ (column) matrices X over F such that $AX = 0$ is a subspace of V .

ITR ROORKEE NPTEL ONLINE CERTIFICATION COURSE 4

So, now let us discuss few examples based on this. Now, first example is V , we are taking as \mathbb{R}^2 , over the real field \mathbb{R} . Now, W , which is given as all x, y naught to such that x plus $2, y$ is equal to 0 , and we have to show that W is a subspace of this vector-space V ok.

(Refer Slide Time: 08:39)

$V = \mathbb{R}^2, F = \mathbb{R}$
 $W = \{(x, y) \in \mathbb{R}^2 : x + 2y = 0\}$

$u, v \in W, \alpha \in F$
 $u = (x_1, y_1), v = (x_2, y_2)$
 $\Rightarrow x_1 + 2y_1 = 0, x_2 + 2y_2 = 0$

$\alpha \cdot u + v = \alpha \cdot (x_1, y_1) + (x_2, y_2)$
 $= (\alpha x_1, \alpha y_1) + (x_2, y_2) = (\underbrace{\alpha x_1 + x_2}_x, \underbrace{\alpha y_1 + y_2}_y)$

$x + 2y = (\alpha x_1 + x_2) + 2(\alpha y_1 + y_2) = \alpha(x_1 + 2y_1) + (x_2 + 2y_2)$
 $= \alpha \cdot 0 + 0 = 0$
 $\Rightarrow (x, y) \in W$

$x + 2y = 0$

Now, what is V here? V is entire \mathbb{R}^2 and field is \mathbb{R} . So, this is something like this, this entire \mathbb{R}^2 is simply a vector-space V over a real field over the real field. Now, W is simply all x, y and \mathbb{R}^2 , such that x plus $2, y$ is equal to 0 . So, it is passing through origin, then x is $0, y$ is 0 . And when x is minus 1 , when x is minus 2 for example, then y , then y

is 1 then y is 1, so it is something this line ok, this is x plus 2, y is equal to 0. So, it is of course, it is of course, a subset of this \mathbb{R}^2 . Now, we have to see that whether, it is a now it is show that it is a subspace of this V . So, you take to arbitrary element in w , and α in field.

So, u is something you can says, u is as x_1, y_1 , and say V is x_2, y_2 . So, this implies x_1 plus 2 y_1 is equal to 0, and x_2 plus 2 y_2 is equal to 0, because u, v are from w , so it will satisfy these properties. Now, if it is a subspace, then we have to show that αu plus v must be in w . So, take αu plus v , so it is αu is x_1, y_1 plus x_2, y_2 , so it is $\alpha x_1, \alpha y_1$. So, here I am taking the usual scalar multiplication ok, because I am taking \mathbb{R}^2 .

So, I have we have taken, the standard addition, vector addition, scalar multiplication ok. It is x_2, y_2 , and when you add them, so it is simply αx_1 plus $x_2, \alpha y_1$ plus y_2 . Again by the standard vector addition now, we have to show that this is in this is in w , so that means, we have to show that x this is x and this is y . So, we have to show that x plus 2 y must be 0, then only we can say that this element is in w .

So, you can take x plus 2 y , now x plus 2 y is αx_1 plus x_2 plus 2 times αy_1 plus y_2 , it is equal to α times x_1 plus y_1 plus x_2 plus 2 y_2 . And it is 0 x_1 plus 2 y_1 is 0 from this equation, and x_2 plus 2 y_2 is 0 from this equation, so it is α into 0 plus 0, which is 0. And this implies x, y belongs to w . So, we can say that this x , and this y is in w , that means, w is a subspace of v .

Now, now similarly if we want to show that this matrix, this vector-space we have taken as all M cross n matrices all the real field \mathbb{R} , and W is a subset of this V , we have taken as all collection of all symmetric matrices, where a equal to a transpose.

(Refer Slide Time: 12:16)

$$\begin{aligned} A, B \in W &\Rightarrow A = A^T, B = B^T \\ C &= \alpha A + B \\ C^T &= (\alpha A + B)^T = \alpha A^T + B^T \\ &= \alpha A + B \\ &= C \\ &\Rightarrow \underline{\underline{C \in W}} \end{aligned}$$

And again if you want to show that a subspace of V , so again it is very easy to show you simply, you simply take two matrices, A comma B belongs to W . So, this implies A is equal to A transpose, and B is equal to B transpose.

And we have to show that a matrix C , which is α dot A plus B is also in W , so that means, you have to show that C is equal to C transpose. So, take C transpose, which is α dot A plus B whole transpose, which is α dot A transpose plus B transpose. And it is α dot A plus B , because A transposes A , and B transposes B , so it is equal to C , so this implies C is in W .

So, we have shown that W is a subspace of this vector-space V , because all the matrices, which is equal to its transpose R in W . And we have shown that C is equal to C transpose, and C is nothing but αA plus B , that means, that means W is a subspace of this vector-space V .

Similarly, similarly we can show for the third problem also, you take two arbitrary element, two arbitrary vectors of P^2 . And try to show that the, it is closed under addition, and the scalar multiplication. All you can show that you can take u and V in P^2 , and you can try to show that α dot u plus V is also in P^2 .

Now similarly, if you take the next example, we are we have taken V as a collection of all functions from R in to R . And we have consider a subset W of V such that f of minus

1 is 0 ok. All those functions, we which are which vanishes at minus 1, these we are taken as W.

So, again in order to show that it is a subspace of this vector-space V, you take any two arbitrary element of this subset W, and try to show that it is closed with respect to addition and scalar multiplication. Now, then the last example, last example of this slide that we are we are taking V as all M cross n cross 1 matrices over the field F. Suppose, A be an M cross n matrix over F is a fix matrix. There are set of all n cross 1 column matrices X over F, such that AX equal to 0 is a subspace of V.

(Refer Slide Time: 14:57)

$$\begin{aligned}
 W &= \{ X \in V \mid AX=0 \} \neq \emptyset \\
 x_1, y_1 &\in W \Rightarrow Ax_1=0, Ay_1=0 \\
 Z &= \alpha \cdot x_1 + y_1 \\
 AZ &= A(\alpha x_1 + y_1) \\
 &= \alpha \cdot (Ax_1) + Ay_1 \\
 &= 0 \\
 \Rightarrow Z &\in W
 \end{aligned}$$

You see that here. Here we have taken a W as all X all X in V such that AX is equal to 0. Here A is a fixed matrix of order M cross n, and this X is a vector of order M cross n cross 1 ok. And the collection of all those X, we are claiming that this W is nothing but a subspace of the vector-space V. Now, now it is easy to show you see that if you again, again you take again you take two elements say x 1 and y 1 in W. Now, of course, of course, this set is never empty, this set is never empty, because this is never empty, because at least X equal to 0 is in the set.

And if it contains a single term 0, so that is a trivial subspace of trivial subspace of V. And if it is if it is not a trivial sub space, so it will contain infinitely many X, such that X equal to 0, because this is a linear system of homogeneous equations, which is either a unique solution infinitely many solutions. If it is as a unique solution, which is X equal

to 0 that is a trivial subspace of V , that is automatically satisfied. But, if and if it has infinitely many solution, then we can prove it like in this way. We will assume that X_1 and Y_1 are 2 elements in W , that means, $A X_1 + A X_1$ equal to 0, and $A Y_1$ equal to 0.

And we have to show that Z , which is $\alpha \cdot X_1 + Y_1$ is also in W . So, you take A into Z , A into Z is $A \alpha \cdot X_1 + Y_1$, which is $\alpha \cdot A X_1$, because α is a scalar, and it is $A Y_1$, and it is 0, and it is 0, so it is 0, so that means, Z belongs to W . And hence, we can say that W is nothing but a subspace of this vector-space V .

So, basically to show that this a subspace, we have to take two cases, first is a unique solution of this, if it is a unique solution that means, trivial subspace, if not unique that is infinitely many solutions, and the and the proof follows on this line ok. So, in this way, we can see that whether, a given subset of a vector-space V consider with the subspace or not. In this way, we can show that it is a subspace of vector given vector-space V .

(Refer Slide Time: 17:52)

The slide contains the following text:

Problems

- 1 Which of the following set of vectors $x = (x_1, x_2) \in \mathbb{R}^2$ are subspaces of \mathbb{R}^2
 - $W_1 = \{(x_1, x_2) \in \mathbb{R}^2 : x_1 \geq 0\}$
 - $W_2 = \{(x_1, x_2) \in \mathbb{R}^2 : x_2 \text{ is rational}\}$
- 2 Let $V = P_2(\mathbb{R})$. Then, which of the following subsets of V are subspaces of V .
 - $S_1 = \{p \in V : p'(1) = 0\}$
 - $S_2 = \{p \in V : p(-1) = 1\}$

At the bottom of the slide, there are logos for IIT ROORKEE and NPTEL ONLINE CERTIFICATION COURSE, and the page number 5.

Now, let us consider few more problems based on this. Now, here in the first problem, we have taken V as \mathbb{R}^2 over the real over the field \mathbb{R} . Now, we have consider W_1 , which is all x_1, x_2 , such that x_1 is greater than equal to 0 ok.

(Refer Slide Time: 18:03)

$V = \mathbb{R}^2, F = \mathbb{R}$
 $W = \{(x_1, x_2) \mid x_1 \geq 0\}$
 $(1, 2) \in W$
 $\alpha = -1$
 $-1 \cdot (1, 2) = (-1, -2) \notin W$

$W = \{(x_1, x_2) \in \mathbb{R}^2, x_2 \text{ is rational}\}$
 $(1, 2) \in W, \alpha = \sqrt{2}$
 $\sqrt{2} \cdot (1, 2) = (\sqrt{2}, 2\sqrt{2}) \notin W$
NOT a subspace

So, what W here is? So, the first example, we have taken V as \mathbb{R}^2 field as \mathbb{R} this is this is the thing. And x_1 greater than equal to 0, x_2 this is x_1 , and this is x_2 , x_1 greater than equal to 0 means this thing. So, whether, whether this half of this \mathbb{R}^2 , we constitute a subspace of this vector-space or not. So, so you see that if it is a subspace, if it is a subspace of this vector-space, then it must be closed with respect to addition as scalar multiplication ok.

Now, if you take element say, say 1 comma 2, 1 comma 2 is in W , yes, because W are all those x_1, x_2 such that x_1 is greater equal to 0, here, x_1 is greater equal to 0, so it is in W . And you take and α is α is any real number it is come from the field.

So, if you take α as minus 1 says, and minus 1 dot 1 comma 2 will be minus 1 comma minus 2, which is not in W , so that means, it is not closed with respect to the scalar multiplication, and that means, it will not constitute a subspace of this vector-space V because, if it is a subspace of the vector-space V , it must be closed with respect to vector addition and scalar multiplication ok.

So, if you have to show that is a subspace of vector-space, then you must show that it is closed respect to addition and scalar multiplication. And if it is not a subspace at all, then simply give a counter example to show that it is not closed with respect to addition or a scalar multiplication.

Now, take second example. Now, here we have considered all x_1, x_2 , in \mathbb{R}^2 . So, x_2 is irrational x_2 is rational. So, again when you take W as all x_1, x_2 all x_1, x_2 in \mathbb{R}^2 , such that x_1 is rational ok, x_2 is rational ok. Now, again if you take say 1 comma 2 , it is in W , because here x_2 is rational.

Now, if you take α is under root 2, then under root 2 dot 1 comma 2 is simply under root 2 comma under root 2 under root 2, which is not in W , because now x_2 is not rational. So, it is not closed with respect to vector I mean scalar multiplication, so that means, it is not a subspace of this vector-space not a subspace, is it clear. Now, discuss second problem, the second problem is we have taken p as V as p_2 , p_2 are all polynomials degree less than equal to 2 over the real field. Then, which are the following subsets of V are the subspaces of V . The first one is all p in V such that p dash 1 equal to 0.

(Refer Slide Time: 21:32)

$$\begin{aligned}
 V &= P_2(\mathbb{R}), & W &= \{ p \in V \mid p'(1) = 0 \}. \\
 p_1, p_2 &\in W & \Rightarrow & p_1'(1) = 0 = p_2'(1). \\
 p &= \alpha \cdot p_1 + \beta_2 & \rightarrow & p' = (\alpha p_1 + \beta_2)' \\
 & & & = \alpha \cdot p_1' + \beta_2' \\
 p'(1) &= \alpha \cdot p_1'(1) + \beta_2'(1) & & p'(1) = (\alpha \cdot p_1' + \beta_2')(1) \\
 &= \alpha \cdot 0 + 0 & & = \alpha \cdot p_1'(1) + \beta_2'(1) \\
 &= 0 & & \\
 \Rightarrow & \underline{\underline{p \in W}} & &
 \end{aligned}$$

So, here V are all p_2 over real field \mathbb{R} , and W we have taken as all p in V , such that p dash 1 is equal to 0. Now, you take two polynomials, p_1 and p_2 in W that means, p_1 dash 1 equal to 0 and p_2 dash 1 is also 0. And if it is a subspace, then it must be closed with respect to vector addition and scalar multiplication, so that means, you take an arbitrary you take this p , and we have if it is a subspace, then we have to show that it is in. Then we have to show that p dash of this p p dash p dash of this p at 1 must be 0. So, what is p dash of this, this is α dot p dash p dash at 1. Suppose, because this implies

that p' is simply $\alpha p_1 + p_2'$. Dash means derivative, which is $\alpha p_1' + p_2'$.

Now, p_1' at 1 is nothing but $\alpha p_1' + p_2'$ at 1, and which is $\alpha p_1'$ at 1 plus p_2' at 1, which is which is this statement ok. And this is $\alpha \cdot 0 + 0$, which is 0, so that means, this p also is in W , and that means, W is a that means, this W is a subspace of the vector-space V .

Now, if you take the second example, second problem here, we have taken p in V , such that $p(-1) = 1$ ok. Now, one important thing is that the additive identity of a vector-space, and all subspaces of that vector-space are same.

(Refer Slide Time: 23:47)

$$V(F) \quad \{0\}$$

$$W = \{ p \in V \mid p(-1) = 1 \}$$

$$u = 2 - x^2 \in W$$

$$v = 3 - 2x^2 \in W$$

$$u+v = \frac{5-3x^2}{\notin W} \quad 5-3(-1)^2 = 5-3=2$$

You take you take a vector-space V , suppose 0 suppose 0 is the you take a vector-space V over the real over the field F , suppose this 0 denotes the additive identity of this vector-space. And you take any subspace of this vector-space V over the field F it will also have the same additive identity 0 .

Now, here, here you can easily see that if you take collection of all those polynomials, where p at minus 1 is 1. Then that that polynomial then 0 polynomial is I mean what I want to say basically that here we are taken all p in V , such that p at minus 1 is 1. Now, now what is the identity of this p_2 is 0 ; this p_2 has a identity 0 . And that is that that

polynomial is not there in this S_2 , because it contains all those polynomials, which are at $x = -1$ is 1.

So, the 0 polynomial is not there, because 0 polynomial at $x = -1$ will attain will equal to 0 only will not be equal to 1, so that means, 0 polynomial is not there, that means, additive identity is not in S_2 . And hence, we can say that this is not a subspace of this vector-space V , or the other way out is or the other way out is you take a two polynomial say you take 1, say you take $1 + x^2$ $1 + x^2 = 2$. So, you take you take any two polynomials, which are at $x = -1$ is 1 ok. So, at $x = -1$ is 1 means, you take $1 + 1$ is it is 2 minus 1.

If you take ok, if you take this polynomial, it is in W , because at $x = -1$ this gives 1. Now, you take another polynomial say $3 - 2x^2$, again it gives at $x = -1$ it gives 1. Now, this is u and this is v , if you add them $u + v$, this is $5 - 3x^2$. And this polynomial this polynomial at $x = -1$ is nothing but is equal to 2, which is not 1, that means, this element does not belongs to W . So, we have shown that it is not closed with respect to vector addition. And hence, we can say that it is not a subspace of this vector-space V .

(Refer Slide Time: 26:44)

Theorem
Let V be a vector-space over the field F . The intersection of any collection of subspaces of V is a subspace of V .

IIT ROORKEE NPTEL ONLINE CERTIFICATION COURSE 6

Now, let vector as V is a vector-space of field F . Then the intersection of any collection of subspaces of V is a subspace of V .

(Refer Slide Time: 26:59)

W_1, W_2, \dots are the subspaces of $V(F)$

$$W = \bigcap_i W_i$$

$u, v \in W, \alpha \in F$ $u, v \in \bigcap_i W_i \Rightarrow u, v \in W_i, \text{ for all } i$

$$z = \alpha \cdot u + v$$

$\Rightarrow \alpha \cdot u + v \in W_i \text{ " "}$

$\Rightarrow z \in W_i \text{ for all } i$

$\Rightarrow z \in \bigcap_i W_i$

$\Rightarrow z \in W$

If you take, if you say if you take W , suppose W_1, W_2 and so on are the subspaces of V over F . Then if you take intersection of all these subspaces, then it will also be a subspace of this vector-space V . Things are very easy to show, you take u and v in W , and α in field. Then since, and you have to show that this W this Z , which is $\alpha \cdot u + v$ is also in W . So, say since u and v is in intersection of W_i , this implies u and v are belongs to W_i for all i . And this implies $\alpha \cdot u + v$ belongs to W_i for all i , because all W_i are subspaces of V . So, it must be closed with respect to addition and scalar multiplication

So, this implies this Z , we also belong W_i for all i . And this implies Z belongs to intersection of W_i also, because if it is in W_i for all i , that means, it is in intersection also, and that means, Z belongs to W , and that means, this W is a subspace of this vector-space V .

(Refer Slide Time: 28:29)

Definition

- Let u_1, u_2, \dots, u_n be n -vectors of a vector space $V(F)$ and let $\alpha_1, \alpha_2, \dots, \alpha_n$ be n -scalars. Then $\alpha_1 u_1 + \alpha_2 u_2 + \dots + \alpha_n u_n$ is called linear combination of u_1, u_2, \dots, u_n .
- The span of a subset S (denoted by $[S]$) of a vector-space V is the set of all linear combination of the vectors in S . That is, if $S = \{u_1, u_2, \dots, u_n\} \subseteq V$, then
$$[S] = \{\alpha_1 u_1 + \alpha_2 u_2 + \dots + \alpha_n u_n : \alpha_i \in F \forall i\}$$

ITR ROORKEE NPTEL ONLINE CERTIFICATION COURSE 7

Now, let u_1, u_2, \dots, u_n be n vectors of a vector space V , and let α_i be our scalars and n -scalars. Then if you take $\alpha_1 u_1 + \alpha_2 u_2 + \dots + \alpha_n u_n$, then this is called linear combination of u_1, u_2, \dots, u_n . So, this and this will be a new vector, this will be a vector. Though this and it is definitely belongs to V , because V is a vector space. So, by the closing closure property of a scalar multiplication, vector addition, this element will be in V itself, and this element is called linear combination of u_1, u_2, \dots, u_n .

Now, we defined we define subset of subset of V , which we called as span of S . Span of a subset S of vector-space V is simply, the collection of all linear combination of vectors in S , now suppose, S is u_1, u_2, \dots, u_n ok. Then a span of S denoted by this bracket span of S is simply, the collection of all linear combinations of u_1, u_2, \dots, u_n . Use you see you vary α_i , these $u_i \in S$ are fixed, you vary α_i , $\alpha_1, \alpha_2, \dots, \alpha_n$, you varies these scalars. You will get so many vectors, and the collection of all those vectors, we are call as a span of S .

Theorem
If S is a non-empty subset of a vector-space V , then $[S]$ is the smallest subspace of V containing S .

ITR ROORKEE NPTEL ONLINE CERTIFICATION COURSE 8

Now, a span of S is nothing but the small S subspace of V containing S .

(Refer Slide Time: 30:21)

$$S = \{u_1, u_2, \dots, u_n\} \subseteq V$$
$$[S] = \left\{ u = a_1 u_1 + a_2 u_2 + \dots + a_n u_n : a_i \in F, \text{ for all } i \right\}$$

$a_i = 1$ for any $i, 1 \leq i \leq n$
 $a_i = 0, i \neq 1$
 $\Rightarrow u_i \in [S]$ for any $i \Rightarrow S \subseteq [S]$

$v, w \in [S], \alpha \in F$
 $\Rightarrow v = a_1 u_1 + \dots + a_n u_n, \quad a_i \in F, \forall i$
 $w = \beta_1 u_1 + \dots + \beta_n u_n, \quad \beta_i \in F, \forall i$
 $\alpha v + w = \alpha \cdot (a_1 u_1 + \dots + a_n u_n) + (\beta_1 u_1 + \dots + \beta_n u_n)$
 $= (\alpha a_1 + \beta_1) u_1 + (\alpha a_2 + \beta_2) u_2 + \dots + (\alpha a_n + \beta_n) u_n$
 $\in [S] \quad [S] \rightarrow \text{subspace of } V$

- $[S]$ is subspace of V
- $S \subseteq [S]$ ✓
- $[S]$ is smallest subspace of V containing S .

So, let us try to prove this. So, so what is S , S is simply u_1, u_2, \dots, u_n it is subset of V all u_i are from V . What is span of S , a span is a set of all those u_i such that this u_1 $\alpha_1 u_1$ plus $\alpha_2 u_2$ and so on up to $\alpha_n u_n$, such that α_i belongs to field for all i .

Now, in this theorem we have to show three things. First we have to show that it is a subspace of V , it contains S we have to show that a span of S is a subspace of V .

Second S is containing span of S ,. And third is a span of has a smallest subspace, a smallest subspace of V containing S .

Now, the now the second property is very easy to show, you see you see this span is containing all the linear combinations of u_1, u_2, \dots, u_n ok. If you take α_1 equal to 1, because α is vary, α is varying from the field. If you take α_1 equal to 1, and all other α equal to 0, then u equal to u_1 , so u_1 is definitely span of S .

Similarly, if you take α_2 equal to 1, and all remaining α_i is are equal to 0. I mean α_2 equal to 1, and all remaining α equal to 0, then u_2 will be in span of S ok. So, so we can say that if α_i you take as 1 for any i for any i from n to 1. And α_j is equal to 0, α_p equal to 0, and p is not equal to i , then this implies u_i belongs to span of S for any i , and this implies as is containing span of S . So, the first part is very easy to show, I mean this part second part is very easy to show. If it contain all the linear combinations of vectors u_1, u_2, \dots, u_n , so it will definitely contains u_1, u_2, \dots, u_n also.

Now, we have to show that it is a subspace of V . So, again you take a two two arbitrary elements of this sets say V and W belongs to the span of S , and α belongs to field. And then we have to show that $\alpha \cdot V + W$ also in span of S . So, since V belongs to the span of S , and this implies V is some linear combination of vectors u_1, u_2, \dots, u_n for α_i belongs to field for all i . And similarly, W will be some other linear combination of u_1, u_2, \dots, u_n , so scalars will be different. So, this will be some scalar combinations.

Now, you take $\alpha \cdot u + w = \alpha \cdot v + w$. So, it is $\alpha_1 u_1$ and so on up to $\alpha_n u_n + w$ is $\beta_1 u_1$ and so on up to $\beta_n u_n$. So, when you applied a definition of standard scalar multiplication, vector addition, you simply get $\alpha_1 + \beta_1$ times u_1 plus $\alpha_2 + \beta_2$ times u_2 , and dot is already there. So, it is $\alpha_1 + \beta_1$ plus $\alpha_n + \beta_n$ dot with u_n .

Now, it is it is some it is some scalar, it is some scalar, it is some scalar, so we can say that it is also some linear combination of u_1, u_2, \dots, u_n . So, we can simply say that it belongs to it belongs to span of S . So, so we can say that it belongs to span of S . Hence and hence, we can say that span of S is nothing but a subspace of field.

Now, we have to show that it is a smallest subspace of V containing S , so how we can say, how we can prove it. In order to show that is the smallest subspace containing as you take an arbitrary subspace say T of V containing S , and try to show that the span of S is also containing T .

(Refer Slide Time: 35:29)

let T be any arbitrary subspace of V containing S .

To show: $\text{span}(S) \subseteq T$

let $w \in \text{span}(S) \Rightarrow w = \alpha_1 u_1 + \alpha_2 u_2 + \dots + \alpha_n u_n$.

$u_i \in T$ for all i

$\alpha_i u_i \in T$ for all i

$\Rightarrow \sum_{i=1}^n \alpha_i u_i \in T$

$\Rightarrow w \in T \Rightarrow \underline{\underline{\text{span}(S) \subseteq T}}$.

So, so let T be any arbitrary any arbitrary subspace of V containing S . And in order to show that span is the smallest such subspace, so we have to show that a span of S is a subset of T . Then we can then only, this will be the smallest one containing S .

So, in order to show that this is a subset of this take an arbitrary element in span of S , and try to show that that element is also in T . So, let say w belongs to span of S , so this implies w is some linear combination of elements u_1, u_2, \dots, u_n and now, what to show, we have to show that this w is also in T , then only we can say that this span is a smallest such subspace.

Now, since u_i belongs to T for all i , and T is a subspace. So, we can say that $\alpha_i u_i$ also in T for all i by the see by the closure property of a scalar multiplication, because T is a subspace ok. And this implies summation of i from 1 to n $\alpha_i u_i$ also belongs to T . Again by the closure property of vector addition, because $\alpha_1 u_1$ is in T , $\alpha_2 u_2$ is in T , $\alpha_n u_n$ is in T . So, by the closure property of vector addition this sum is also in T ok, so that this implies w is in T ok, and this implies span of S is a subset of T . So, hence we have shown that this span is a smallest subspace of V containing S .

So, so in this lecture, we have seen that a subset of a vector-space V . If you want to show that it is S subspace of given vector-space V , we have to simply show that it is closure with respect to vector addition scalar multiplication. If it is not a subspace of that vector space, simply give a counter example, which content either closure properties with respect to addition or scalar multiplication. We have also seen that span of S , which is the collection of all linear combination of vectors in S , a simply as smallest subspace of V containing S .

Thank you.
