**Lecture – 33**  
**Controllability of Autonomous Systems**

Dear students, welcome to this lecture on the controllability of linear time invariant control systems. So, in this lecture we will see the definition of controllability and a necessary and sufficient condition for the controllability of a linear autonomous dynamical system or control system. So, controllability deals with the concept of controllability deals with the ability of a dynamical system to reach any arbitrary final state.

From any arbitrary initial state during finite a time interval using a control function. So, this concept is called the controllability of the control system. So, to understand the controllability concept let us consider a simple example.

**(Refer Slide Time: 01:29)**

The image shows handwritten mathematical work on a slide. On the left, there is a graph of a curve in the first quadrant of a Cartesian coordinate system. The vertical axis is labeled 'x' and the horizontal axis is labeled 't'. The curve starts at a point on the vertical axis labeled 'x<sub>0</sub>' and increases exponentially towards the right. The horizontal axis has a tick mark labeled 'T'. To the right of the graph, the following text is written:

$\frac{dx}{dt} = 2x(t) : x(0) = x_0$   
 $\Rightarrow$  the solution  $x(t) = e^{2t} \cdot x_0$   
 % T is final time then  
 $x(T) = e^{2T} \cdot x_0 = x_1$

On the right side of the slide, the following derivation is shown:

$\frac{dx}{dt} = 2x + u(t)$   
 $x(0) = x_0$   
 then  
 $x(t) = e^{2t} x_0 + \int_0^t e^{2(t-s)} u(s) ds$   
 At  $t = T$   
 $x(T) = e^{2T} x_0 + \int_0^T e^{2(T-s)} u(s) ds$   
 %  $x_1$  is an arbitrary value then  
 using the control  
 $u(s) = e^{2(s-T)} \cdot [x_1 - e^{2T} x_0]$   
 then we set  
 $x(T) = x_1$

So, let us consider the dynamical system  $dx/dt = 2x$  and initial condition  $x$  of 0 is  $x_0$ ,  $t$  is the time variable and the  $x$  of 0 is the initial condition given. Then we can easily see that the solution  $x$  of  $t$  or the state of the system at time  $t$  it is given by  $e$  to the power  $2t \cdot x_0$ . So, here we can see that if  $t$  is the final time okay any finite value  $T$  then the final state  $x$  of  $T$  is  $e$  to the power  $2T \cdot x_0$ .

So, what we can see here is this is a  $t$  axis and this is  $x$  of  $t$ . So, at  $t=0$  the value is  $x_0$  and when  $t=T$  the function reaches the state  $x_1$  let us call it as  $x_1$ . So, you can see that only this particular  $x$  of  $T$  can be reached by the system if you start with the initial condition  $x_0$ . Because there existing unique solution for this and so no other final state can be obtained but in this case if you consider a control system with the same dynamical system.

If you include the control term  $u$  of  $t$  with the initial state  $x_0$  then we can see that the solution  $x$  of  $t$  is given by  $e^{-\lambda t} x_0 + \int_0^t e^{-\lambda(t-s)} u(s) ds$ . Now at the final time instant  $T$  we will get the final state  $x$  of  $T$  is given by this expression  $e^{-\lambda T} x_0 + \int_0^T e^{-\lambda(T-s)} u(s) ds$  it gives the final state of the system. Now we are free to choose the control function  $u$  of  $t$ .

So, by selecting a suitable  $u$  of  $t$  function we can get any arbitrary value for  $x$  of  $T$ . So, if  $x_1$  any arbitrary vector here  $x_1$  is a real value so any arbitrary value okay then we can get then using the control okay. Let us select the control function  $u$  of  $s$  as  $e^{-\lambda(T-s)}$  if you substitute in the place of  $u$  of  $s$  multiplied by the function  $x_1 - e^{-\lambda T} x_0$  So, we can see that if you substitute this  $u$  of  $s$  function in the inside the integral.

We will get then we get  $x$  of  $T=x_1$  so it is the simplest way of selecting a control so that the final condition is arbitrary value  $x_1$ . So, this is the concept of controllability if you are able to find a control function so that the final position  $x$  of  $t$  is any arbitrary given condition. Then the system is called controllable so we will see the definition of the controllability.

**(Refer Slide Time: 06:41)**

$$\left. \begin{aligned} \dot{x}_1(t) &= 2x_1(t) + u(t) \\ \dot{x}_2(t) &= x_2(t) \\ x_1(0) &= \alpha_1 \quad x_2(0) = \alpha_2 \end{aligned} \right\} \textcircled{1}$$

Then the system  $\textcircled{1}$  is not controllable.

Solving the above

$$x_2(t) = e^t \alpha_2$$

At  $t = T$

$$x_2(T) = e^T \alpha_2$$

$$x(t) = \begin{bmatrix} x_1(t) \\ x_2(t) \end{bmatrix}$$

But before that let us consider this example again  $x_1$  of  $t$  derivative that is  $\dot{x}_1 = 2x_1 + u$  and another variable  $x_2$  of  $t$  is let us say  $\dot{x}_2 = x_2$  and some initial condition  $x_1$  at time  $t = 0$  is a value say  $\alpha_1$  and  $x_2$  at  $0$  is  $\alpha_2$  so in this case we can see that in whichever ways we selected the control function  $u$  of  $t$  the second variable  $x_2$  of  $t$  can never be controlled as we wish.

Because if you solve this equation we will get solving the above equation we will get to  $x_2$  of  $t$  is  $e^t \alpha_2$ . So, any final time we take okay we take  $x_2$  of  $T$  is a constant single value except this value we cannot get any other value for  $x_2$  of  $T$ . So, the solution of the system or the state variable  $x$  of  $t$  which is the vector here  $x_1$  of  $t$   $x_2$  of  $t$  so, this cannot be controlled as we wish.

If you assign arbitrary final position for  $x_1$  of  $t$  and  $x_2$  of  $t$  we will not be able to reach that position because  $x_2$  of  $T$  is fixed value only one value can be reached always. So, this system is not controllable so if you call the system to be 1 then the system 1 is not controllable because whatever control we substitute we will never reach any arbitrary final condition. We will be able to reach only if fix to final condition for the variable  $x_2$ . So, the definition of controllability is given here.

**(Refer Slide Time: 09:18)**

## Controllability

### Definition

The linear time varying system defined by

$$\dot{x}(t) = A(t)x(t) + B(t)u(t)$$

where  $A$  is  $n \times n$  and  $B$  is  $n \times m$  matrix is said to be controllable if for any  $t_0$ , and any initial state  $x(t_0) = x_0$  and any given state  $x_1$ , there exists a final time  $T$  and a control function  $u(t)$ ,  $t_0 \leq t \leq T$ , such that  $x(T) = x_1$ .

$$x_0 \in \mathbb{R}^n \quad x_1 \in \mathbb{R}^n$$

So, the linear time varying system general system we take  $\dot{x}(t) = A(t)x(t) + B(t)u(t)$  where  $A(t)$  is a  $n \times n$  and  $B(t)$  is a  $n \times m$  matrix. So, this system is said to be controllable if for any initial time  $t_0$  and any initial state  $x(t_0) = x_0$  and given arbitrary state  $x_1$  in  $\mathbb{R}^n$  space  $x_0$  belongs to  $\mathbb{R}^n$  then there exist their final time  $T$  and a control function  $u(t)$  such that  $x(T) = x_1$ . So, that means we will be able to find a control function  $u(t)$  and a final time  $T$ .

So, that the final position of the solution is  $x_1$  which is the arbitrary value in the state space. So, if this happens then we say that this system is controllable and if you are not able to find a control function like this for any arbitrary  $x_1$  we will not be able to find a control. Then we call it as uncontrollable system but it does not mean that we cannot reach any final condition. We will be able to reach some final condition  $x(T)$ . But all the points in the space may not be able to reach by the system.

**(Refer Slide Time: 11:12)**

## Kalman Condition

### Theorem

The necessary and sufficient condition for the controllability of the system

$$\dot{x}(t) = \underbrace{A}_{n \times n} x(t) + \underbrace{B}_{n \times m} u(t) \quad (1)$$

is

$$\text{rank}[B \quad AB \quad A^2B \quad \dots \quad A^{n-1}B]_{n \times nm} = n \quad (2)$$

nod07/lec33

So, the condition for controllability of the autonomous system that is the matrix A and B are constant matrices. So is given by the rank condition the necessary and sufficient condition for controllability of the system 1 is the rank of the matrix B AB A square B etc A power n-1 B is =n. Here A is the n\*n matrix and B is n\*m. So, we have n\*m matrix n times. So, the size of the matrix given in the bracket is n\*m.

So, the maximum rank for this matrix is n the smallest the minimum number out of this two. So, maximum rank can be n but the system will be controllable if and only if the rank is=n. So, that is called the Kalman theorem Kalman condition for the controllability of the system 1.

**(Refer Slide Time: 12:33)**

### Proof

#### Necessary Condition:

Let the system be controllable.

To prove that  $\text{rank}(U) = n$  where  $U = [B \quad AB \quad \dots \quad A^{n-1}B]_{n \times nm}$ . If  $\text{rank}(U) < n$ .

Then there exists a vector  $\alpha \in R^n$  such that  $\alpha \neq 0$  and  $\alpha'U = 0$ . The system is controllable (given).

The solution of system (1) with initial condition  $x(t_0) = x_0$  is

$$x(t) = e^{A(t-t_0)}x_0 + \int_{t_0}^t e^{A(t-s)}Bu(s)ds \quad (3)$$

$t = T$        $x(T) = x_0$

$U: R^{mn} \rightarrow R^n$   
 $U': R^n \rightarrow R^{mn}$   
 $U'x = 0, x \neq 0$

So, let us prove it the necessary condition if the system is controllable then we have to prove that the rank of the matrix  $U=n$  where  $U$  is given by  $B AB A^2 B A^3 \dots B A^{n-1} B$ . So, this is the statement of the theorem now if the system is controllable by the rank is  $<n$  then we will arrive at a contradiction in the following way. So, if the rank of  $U$  is  $<n$  then there exist a vector  $\alpha$  in  $R^n$  the state space and  $\alpha$  is non-zero such that the transpose  $\alpha^T U=0$ .

So,  $U$  is a mapping from  $R^{mn}$  to  $R^n$  so we can show that similarly the transpose  $U^T$  is from  $R^n$  to  $R^{mn}$  so you have the rank of  $U$  is  $<n$  the rank of  $U^T$  is also  $<n$ . Both are from the same rank we will get a vector  $U^T \alpha =0$  and  $\alpha^T U=0$  if rank is  $<n$  this will happen if you take the transpose you will get  $\alpha^T U=0$  for some non-zero vector  $\alpha$ . So, this system is controllable is given here the solution of the equation 1 is given by this.

Where  $e^{A(t-t_0)}$  is the state transition matrix and the solution at the final point  $T$ . So, if you substitute in the equation in the equation 3 the solution if you put  $t = T$  the final time and  $x(t) = \alpha$  and  $x_0 = 0$  because the system is controllable given so for any initial condition and any final condition we will be able to find a control  $U$  because the system is controllable. So, now we substitute the arbitrary value  $\alpha$  for the final condition and the  $0$  condition for initial.

**(Refer Slide Time: 15:06)**

Let  $x(T) = \alpha$  and  $x_0 = x(t_0) = 0$ .

$$\Rightarrow \alpha = \int_{t_0}^T e^{A(T-s)} B u(s) ds \quad (4)$$

(we can find a control satisfying the above).

Using Cayley-Hamilton theorem we can write

$$e^{A(T-s)} = a_0(s)I + a_1(s)A + \dots + a_{n-1}(s)A^{n-1} \quad (5)$$

mod07lec33

So, from equation 3 we will get this  $\alpha = \int_{t_0}^T e^{A(T-s)} B u(s) ds$  so directly we can check so and this system is controllable. So, we will be able to find a control

satisfying the equation 4. Now using Caley Hamilton theorem, the any function of the matrix here it is the exponential  $A T-s$  it can be written as a polynomial expression of a polynomial in the matrix  $A$ . So, this expression is due to Caley Hamilton theorem so if you substitute in the place of  $e$  to the power  $AT-s$ .

**(Refer Slide Time: 15:49)**

substituting (5) in (4) we get

$$\begin{aligned} \alpha &= \int_{t_0}^T e^{A(T-s)} B u(s) ds = \int_{t_0}^T (a_0(s)I + a_1(s)A + \dots + a_{n-1}(s)A^{n-1}) B u(s) ds \\ \Rightarrow \alpha &= \int_{t_0}^T (a_0(s)B + a_1(s)AB + \dots + a_{n-1}(s)A^{n-1}B) u(s) ds \\ &= \int_{t_0}^T (B a_0(s) u(s) + A B a_1(s) u(s) + \dots + A^{n-1} B a_{n-1}(s) u(s)) ds \\ &= B \int_{t_0}^T a_0(s) u(s) ds + AB \int_{t_0}^T a_1(s) u(s) ds + \dots \end{aligned}$$

$B \begin{bmatrix} v_1 \\ v_2 \\ \vdots \\ v_m \end{bmatrix} + AB \begin{bmatrix} v_1 \\ v_2 \\ \vdots \\ v_m \end{bmatrix} + \dots$

That polynomial expression we get  $\alpha = \int_{t_0}^T$  in this expression now we can bring this  $B$  matrix inside the bracket  $a_0 * B$   $a_1 * AB$  etc and this  $a_0$   $a_1$   $a_{n-1}$  all these are scalar functions. So, it can be written in anywhere they are commutative so we can write the first term as  $B * a_0 * u(s)$  this  $u$  of  $s$  also can be brought inside and then second term is  $AB$  and  $a_1$  of  $s$  can be written here multiplied by  $u$  of  $s$ .

So, we get this similarly  $A^{n-1} B * a_{n-1}$  of  $s * u(s)$  everything is integrated with  $ds$ . So, this expression can be written like this the first a term can be written as because  $B$  is a constant matrix it can be taken out we will get  $\int_{t_0}^T a_0(s) u(s) ds$ . Similarly the second term is  $AB \int_{t_0}^T a_1(s) u(s) ds + \dots$ . So, here we can see that  $u$  is a  $m * 1$  matrix. So, when we do the integration  $t_0$  to  $T$  of this expression we will get a vector here that is  $B$  is the matrix.

After doing the integration and putting the limit we will get a constant vector so we will call it as  $v_{10}$   $v_{20}$  etc  $v_{m0}$  and  $+AB$ . Again we will get a constant vector after doing the integration that is  $v_{11}$   $v_{21}$   $v_{m1}$  so all these vectors are in  $R^m$  space.  $m$  vector.

(Refer Slide Time: 18:20)

$$= B \begin{bmatrix} v_1^0 \\ v_2^0 \\ \cdot \\ \cdot \\ v_m^0 \end{bmatrix} + AB \begin{bmatrix} v_1^1 \\ v_2^1 \\ \cdot \\ \cdot \\ v_m^1 \end{bmatrix} + \dots + A^{n-1} B \begin{bmatrix} v_1^{n-1} \\ v_2^{n-1} \\ \cdot \\ \cdot \\ v_m^{n-1} \end{bmatrix}$$

So, we will get the expression like this the 0 indicates that it is due to the coefficient indicating the coefficient a0 if the coefficient is a1 of s integral we call it says v11 v21 etc. So, we get an expression of this type.

(Refer Slide Time: 18:45)

$$\alpha = [B \quad AB \quad A^2B \quad \dots \quad A^{n-1}B]_{n \times nm} \begin{bmatrix} v_1^0 \\ \cdot \\ \cdot \\ v_m^0 \\ v_1^1 \\ \cdot \\ v_m^1 \\ \cdot \\ \cdot \\ v_1^{n-1} \\ \cdot \\ v_m^{n-1} \end{bmatrix}_{nm \times 1} \circ$$

So, this can be further written as this one B AB A square B etc A power so the first vector B\* the first vector + AB\*the second vector etc. So, the same previous expression can be written in this particular form. So, it is nothing but the matrix U which we considered and this is a Vector and U is a mapping from R mn to Rn space. So, alpha belongs to Rn here and that is =this expression U\* we can call it as a matrix v the vector v. So, U\*v =alpha so this is the equation we are getting.

(Refer Slide Time: 19:41)

$$\alpha = U \begin{bmatrix} \end{bmatrix}_{nm \times 1}$$

$$\Rightarrow \alpha' \alpha = \alpha' U \begin{bmatrix} \end{bmatrix}_{nm \times 1}$$

Since  $\alpha' U = 0$  we get

$$\alpha' \alpha = \|\alpha\|^2 = 0$$

$$\Rightarrow \alpha = 0 \text{ a contradiction}$$

mod07lec33  $\Rightarrow U$  has rank  $n$

Alpha = U\*the v vector now if you multiply both sides by alpha dash we will get the alpha dash\*alpha is alpha dash U\* this. But other assumption is U is singular therefore the vector alpha dash exist so that alpha dash U = 0. So, this term becomes 0 so what we get is alpha dash\*alpha which is norm of alpha square that is =0 this because of this one. So, this implies alpha is 0 its a contradiction so this implies that U has rank n.

(Refer Slide Time: 20:40)

### Sufficient Condition:

Let  $\text{rank} U = n$ . To prove that the system is controllable.

Let  $x_0$  and  $x_1$  be arbitrary vectors in  $R^n$ . Then from (3) we get

$$\Rightarrow x_1 = e^{A(T-t_0)} x_0 + \int_{t_0}^T e^{A(T-s)} B u(s) ds$$

So, now we will prove the sufficient condition so let us assume that rank of U is n and we want to prove that the system is controllable. So, let x0 and x1 be arbitrary vectors in Rn. So, if the system is controllable we will be able to find the control function so that the initial condition is

the  $x_0$  and final condition is  $x_1$ . So, our assumption is the rank of  $U$  is  $n$  so when we write the solution of the system and put  $x$  of  $T$  that is when we put  $t = T$  in the solution.

And writing  $x_1$  as final condition  $x_0$  as initial condition we will get the equation like this  $x_1 = e^{A(T-t_0)} x_0 + \int_{t_0}^T e^{A(T-s)} B u(s) ds$ . Again making use of the same technique which we used earlier using Caley Hamilton theorem  $e^{A(T-s)}$  can be replaced by the polynomial expression.

**(Refer Slide Time: 21:58)**

$$\Rightarrow \underline{x_1} - e^{A(T-t_0)} \underline{x_0} = [B \ AB \ A^2 B \ \dots \ A^{n-1} B]_{n \times nm} \begin{bmatrix} v_1^0 \\ \vdots \\ v_m^0 \\ v_1^1 \\ \vdots \\ v_m^1 \\ \vdots \\ v_1^{n-1} \\ \vdots \\ v_m^{n-1} \end{bmatrix}_{nm \times 1}$$

*LHS is arbitrary vector in  $\mathbb{R}^n$*

And then okay making use of the integration, we will get a similar expression the same expression we will get this way only thing is in this case we do not know what is the vector  $v_1$  etc this vector  $v$  is unknown and  $x_0$  and  $x_1$  are two given arbitrary vectors so the left hand side is arbitrary vector in  $\mathbb{R}^n$ . Because  $x_0$  and  $x_1$  are arbitrary vectors so we will get the equation this form.

**(Refer Slide Time: 22:40)**

$$U: \mathbb{R}^{mn} \rightarrow \mathbb{R}^n$$

LHS is an arbitrary vector  $\beta$  in  $\mathbb{R}^n$ .

$$\Rightarrow \beta = U\gamma \text{ where } \gamma \in \mathbb{R}^{mn} \text{ and } \beta \in \mathbb{R}^n.$$

Since  $\text{rank}U = n$  we can find a  $\gamma \in \mathbb{R}^{mn}$  such that  $U\gamma = \beta$ . From  $\gamma$  we can find the control  $u(t)$ .

$\Rightarrow$  The system is controllable.

$$u = \text{vect } \underline{u} = \begin{bmatrix} u_1^0 \\ u_2^0 \\ \vdots \\ u_m^0 \\ u_1^1 \\ u_2^1 \\ \vdots \\ u_m^1 \\ \vdots \\ u_1^{n-1} \\ u_2^{n-1} \\ \vdots \\ u_m^{n-1} \end{bmatrix} \quad \begin{bmatrix} u_1^0 \\ u_2^0 \\ \vdots \\ u_m^0 \end{bmatrix} = \int_{t_0}^T a_0(s) u(s) ds = \beta_0$$

$$\begin{bmatrix} u_1^1 \\ u_2^1 \\ \vdots \\ u_m^1 \end{bmatrix} = \int_{t_0}^T a_1(s) u(s) ds = \beta_1$$

mod07lec33

If you write to the left hand side vector as beta and the vector given in the right hand side is gamma here so we get an equation  $\beta = U\gamma$  and the rank of U is =n has given in the sufficient condition. So, we will get a solution for this expression so  $U\gamma = \beta$  if rank of U is n there exist a gamma which satisfies this equation. So, the system is controllable because we will be able to get a gamma function.

We get the gamma value which is given by this vector  $v_1^0, v_m^0$  etc and then  $v_1^1, v_m^1$  so lastly we will get  $v_m$  so we get the vector gamma it is not a unique solution there will be infinitely many such solution. Because the size of the matrix U is U is a mapping from  $\mathbb{R}^{mn}$  to  $\mathbb{R}^n$ . So, for every given vector beta in  $\mathbb{R}^n$  you will get many solution vector gamma belongs to  $\mathbb{R}^{mn}$  so that  $U\gamma = \beta$  because of the size of the matrix.

So, now each value for example if you take  $v_1^0$  it is nothing but integral  $t_0$  to T  $a_0$  of  $s u(s) ds$  is it not  $v_1^0$  to  $v_m^0$ . So, this vector is given by this expression similarly  $v_1^1, v_2^1, v_m^1$  so this vector is given by  $t_0$  to T  $a_1 s u(s) ds$  so etc. So, then we have the gamma vector with us we can find the function u of s satisfying these conditions because of the relation given by this gamma and the u function.

So, if you are able to get the gamma vector we will be able to get the control function u of t using this relation. So, the system is controllable that is for any given initial condition and any given

final condition we are able to find a control  $u$  of  $t$  for this control system. So, this system is controllable here. So, in this lecture we have seen the necessary and sufficient condition for the controllability of an autonomous system.

So, in the next lecture, we will see the necessary and sufficient condition for the controllability of non-autonomous system that is time varying system. Thank you.
