**Power Series**

Hello friends, welcome to my lecture on Power Series. An important special case of a series of complex value functions is the general power series.

**(Refer Slide Time: 00:38)**

An important special case of a series of complex valued functions is the general power series

$$\sum_{n=0}^{\infty} c_n(z - z_0)^n = c_0 + c_1(z - z_0)^1 + c_2(z - z_0)^2 + \dots + c_n(z - z_0)^n + \dots \quad (1)$$

where  $c_0, c_1, c_2, \dots, c_n, \dots$  are, in general, complex numbers, called coefficients of the power series, and  $z_0$  is any fixed point in the complex plane, called the center of the power series. A special case of equation (1) is the power series

$$\sum_{n=0}^{\infty} c_n z^n = c_0 + c_1 z + c_2 z^2 + \dots$$

whose center is at the origin.

IT ROORKEE    NPTEL ONLINE CERTIFICATION COURSE    2

Sigma  $n=0$  to infinity  $C_n z - z_0$  to the power  $n$  which can expressed as  $C_0 + c_1 z - z_0 + C_2 z - z_0$  to the power square and so on  $c_n z - z_0$  to the power  $n$  and so on, where  $C_0, C_1, C_2, C_n$  are, in general complex numbers and are called the coefficients of the power series,  $z_0$  is any fixed point in the complex plane called the center of the power series. A special case of this equation 1 is the power series where  $z_0 = 0$ .

That is sigma  $n=0$  to infinity  $C_n z$  to the power  $n = C_0 + C_1 z + C_2 z$  square and so on. So the center of this power series is at the origin. Any complex polynomial say  $f(z) = C_0 + c_1 z + c_2 z$  square and so on.

**(Refer Slide Time: 01:32)**

**Example 1**  
Any complex polynomial

$$f(z) = c_0 + c_1 z + c_2 z^2 + \dots + c_n z^n$$

can be thought of as a power series which converges for all  $z$ .

**Example 2**  
The power series

$$\sum_{n=0}^{\infty} z^n$$

converges for all  $z$  in  $|z| < 1$  and is equal to  $\frac{1}{1-z}$  on this disc. If  $z = 1$ , it is clear that the series does not converge.

*Handwritten notes:*  
 $S_n = 1 + z + z^2 + \dots + z^{n-1}$   
 $\lim_{n \rightarrow \infty} S_n = \infty$   
 $S_n = \frac{1(1-z^n)}{1-z}$   
 If  $|z| < 1$  then  $\lim_{n \rightarrow \infty} z^n = 0$  & hence  $\lim_{n \rightarrow \infty} S_n = \frac{1}{1-z}$   
 If  $z = 1$  then  $S_n = n$  and  $\lim_{n \rightarrow \infty} S_n = \infty$

$C_n z^n$  to the power  $n$  can be thought of as a power series which converges for all  $z$ . So here you can see that  $C_{n+1}$ ,  $C_{n+2}$  are the coefficient  $C_{n+1}$ ,  $C_{n+2}$  and so on all 0's so it represents a power series and it converges for all  $z$  because for any  $z$  in the complex series we can find the sum of the series. Now the power series,  $\sum_{n=0}^{\infty} z^n$  converges for all  $z$  in  $|z| < 1$  and is equal to  $1/(1-z)$  on the circular disc  $|z| < 1$ .

If  $z=1$  then we will have the  $n$ th term of the power series as says 1 and so the  $n$ th term of the power series does not go to 0 and therefore the series does not converge. So we can see that this series converges for all  $z$  in  $|z| < 1$ , let us take the  $n$ th partial sum of the series  $S_n = 1 + z + z^2 + \dots + z^{n-1}$  then it is a geometry series and therefore  $S_n = 1 * (1 - z^n) / (1 - z)$ .

Now, if  $|z| < 1$  then  $\lim_{n \rightarrow \infty} z^n = 0$ , okay it is equal to 0. And hence,  $\lim_{n \rightarrow \infty} S_n(z) = 1/(1-z)$ . So the sum of the series is  $1/(1-z)$  whenever  $|z| < 1$ , okay. So we can say that the series converges for all  $z$  such that  $|z| < 1$  and this is equal to  $1/(1-z)$  on this circular disc  $|z| < 1$  the center at  $z=0$  and radius 1.

If  $z=1$ , then we can see that here also we can  $S_n = 1 + 1 + \dots + 1$  that is  $n$ , so  $\lim_{n \rightarrow \infty} S_n = \infty$  and therefore the series diverges for  $z=1$ . Hence the series converges for all  $z$  such that  $|z| < 1$  and diverges at  $z=1$ .

(Refer Slide Time: 04:13)

**Example 3**

The power series

$$\sum_{n=0}^{\infty} \frac{z^n}{n!} = \sum_{n=0}^{\infty} f_n(z)$$

by ratio test, the series converges absolutely for all finite  $z$ .

Here  $f_n(z) = \frac{z^{n-1}}{(n-1)!} = n^{\text{th}} \text{ term}$

Actually, the given series is  $\exp(z)$ :

Here  $f_n(z) = \frac{z^n}{n!}$

Hence  $\lim_{n \rightarrow \infty} \left| \frac{f_n(z)}{f_{n-1}(z)} \right| = \lim_{n \rightarrow \infty} \left| \frac{z^n / n!}{z^{n-1} / (n-1)!} \right| = \lim_{n \rightarrow \infty} \frac{1}{n} |z| = 0, \text{ for all finite } z$

By ratio test, the series converges absolutely for all finite  $z$ .

Now let us consider the power series. So  $\sum_{n=0}^{\infty} z^n / n!$  then we can see that this series converges absolutely for all finite  $z$ , we can do that by ratio test. So here  $f_n(z)$  the  $n^{\text{th}}$  term of the series  $f_n(z) = z^n / n!$ ,  $n^{\text{th}}$  terms of the series  $f_n(z)$  is; we are writing the series as  $\sum_{n=0}^{\infty} f_n(z)$ . So  $f_n$ ; this  $n^{\text{th}}$  term of the series, we start with  $n=0$  so  $n^{\text{th}}$  term, this is  $n^{\text{th}}$  term; actually this is  $n^{\text{th}}$  term, okay.

So  $n^{\text{th}}$  terms is actually here, it is  $f_{n-1}$ ,  $f_{n-1}$  is the  $n^{\text{th}}$  term of this series, so  $f_{n-1} z$  is  $z$  to the power  $n-1 / (n-1)!$  and then  $f_n(z) = z^n / n!$ . Hence,  $\lim_{n \rightarrow \infty} \left| \frac{f_n(z)}{f_{n-1}(z)} \right| = \lim_{n \rightarrow \infty} \left| \frac{z^n / n!}{z^{n-1} / (n-1)!} \right| = \lim_{n \rightarrow \infty} \frac{1}{n} |z| = 0, \text{ for all finite } z$ , okay. And this is equal to 0 for all finite  $z$ , okay.

So this limit is  $< 1$ , okay. And therefore, the series converges absolutely by ratio test, the series converges absolutely, for all finite  $z$ . Actually it is nothing but the exponential  $z$ , okay this  $\sum_{n=0}^{\infty} z^n / n!$  is exponential  $z$ , the given series is exponential  $z$ .

(Refer Slide Time: 07:11)

#### Theorem 4

For every power series given by (1) there is a number  $R$ ,  $0 \leq R \leq \infty$ , called the radius of convergence such that

- (a) The series converges absolutely for every  $z$  with  $|z - z_0| < R$ . If  $0 \leq \rho < R$ , the convergence is uniform for  $|z - z_0| \leq \rho$ ;
- (b) for  $|z - z_0| > R$ , the series diverges;
- (c) for  $|z - z_0| = R$ , the series may or may not converge;
- (d) the sum of the series is an analytic function in the disk  $|z - z_0| < R$ . Its derivative can be found by term-by-term differentiation and the derived series has the same radius of convergence.

Now like in case of real calculus, we know that every power series has radius of convergence which lies between 0 and infinity,  $0 \leq R < \infty$ . So here also in the; we are considering a generalization of the power series for complex functions. So for every power series given by 1, let us see given by 1, for every power series given by this equation 1, okay there is a number  $R$ ,  $0 \leq R \leq \infty$  called the radius of convergences such that the series converges absolutely for every  $z$  mod of  $z - z_0 < R$ .

If  $0 \leq \rho < R$  then the convergence is uniform for mod of  $z - z_0 \leq \rho$ , if mod  $z - z_0$  is  $> R$  the series diverges and for mod of  $z - z_0 = R$  the series may or may not converge. The sum of the series is an analytic function in the disc mod of  $z - z_0 < R$  is derivative then we found by term by term differentiation and the derived series as the same radius of convergence. So this result we have.

**(Refer Slide Time: 08:25)**

The radius of convergence  $R$  is given by the formula

$$\frac{1}{R} = \lim_{n \rightarrow \infty} \left| \frac{c_{n+1}}{c_n} \right|$$

or

$$\frac{1}{R} = \lim_{n \rightarrow \infty} |c_n|^{\frac{1}{n}}$$

If the limit does not exist, then

$$\frac{1}{R} = \overline{\lim}_{n \rightarrow \infty} |c_n|^{\frac{1}{n}} \quad (\text{Cauchy-Hadamard formula})$$

IT ROOKIEE MPTEL ONLINE CERTIFICATION COURSE 6

In case, the limit here, if the limit of mod of  $C_{n+1}/C_n$  exist okay then it is equal to  $1/R$ . you can also find this radius of convergence or by using the ratio test so  $1/R = \lim_{n \rightarrow \infty} \text{mod of } C_n \text{ rest to the power by } n$ , if this limit does not exist then the Cauchy-Hadamard formula says that  $1/R = \limsup_{n \rightarrow \infty} \text{mod of } C_n \text{ raise to the power } 1/n$ .

**(Refer Slide Time: 08:56)**

The circle  $|z - z_0| = R$  is called the circle of convergence of the series in equation (1).

For  $|z - z_0| \leq \rho < R$ , the power series converges uniformly for if  $\rho < \rho' < R$  then

$$|c_n(z - z_0)^n| \leq |c_n|\rho^n \leq \left(\frac{\rho}{R}\right)^n < \left(\frac{\rho}{\rho'}\right)^n \quad \text{for } n \geq n_0$$

in view of  $\lim_{n \rightarrow \infty} |c_n|^{\frac{1}{n}} = R$ . Since  $\frac{\rho}{\rho'} < 1$ , the geometric series  $\sum \left(\frac{\rho}{\rho'}\right)^n$  is convergent. Hence by Weierstrass M-test, the series in (1) is uniformly convergent in  $|z - z_0| \leq \rho < R$ . Since every term of the series in (1) is analytic so the sum function of the series is analytic  $|z - z_0| \leq \rho < R$ . Further, the derivative of the sum function can be found by term by term differentiation. Hence, if

$$f(z) = \sum_{n=0}^{\infty} c_n(z - z_0)^n, \quad |z - z_0| \leq \rho < R.$$

IT ROOKIEE MPTEL ONLINE CERTIFICATION COURSE 7

Now the session A, that is the power series converges absolutely for every  $z$  big mod of  $z - z_0 < R$  can be easily seen by applying the ratio test to the series 1, okay. We shall show that the series converges uniformly whenever mod of  $z - z_0$  is  $\leq \rho$  and  $\rho$  is strictly  $< R$ . So let us first show this. The circle mod of  $z - z_0 = R$  is called the circle of convergence of the series in

equation 1. So when  $\text{mod of } z - z_0 \text{ is } < R = \rho$  and  $\rho \text{ is } < R$  we shall show that the power series converges uniformly.

Now, why it converges uniformly, the power series converges uniformly for if  $\rho \text{ is } < \rho_0 < R$ . So let us take a number  $\rho_0$  which lies between  $\rho$  and  $R$ . Let  $\rho \text{ be } < \rho_0$  and  $\rho_0 \text{ is } < R$  then the  $n$ th term of the power series  $\text{mod of } C_n z - z_0 \text{ to the power } n$  is  $\leq \text{mod of } C_n$ ,  $\text{mod of } z - z_0$  is  $\leq \rho$ , so  $\rho$  to the power  $n$  and this is  $\leq \rho/R$  to the power  $n$  because, but since  $1/R = \lim_{n \rightarrow \infty} \text{mod of } C_n \text{ to the power } 1/n$ , okay.

So since this is  $1/R = \lim_{n \rightarrow \infty} \text{mod of } C_n \text{ to the power of } n/n$  there exists some  $n_0$  such that for  $n \geq n_0$   $\text{mod of } C_n$  is  $\leq 1/R$  to the power  $n$ . So  $\text{mod of } C_n$  is  $\leq \rho/R$  to the power  $n$  and  $\rho_0 \text{ is } < R$ ,  $\rho_0 \text{ is } < R$  so  $1/\rho_0 \text{ is } > 1/R$  or we can say  $1/R \text{ is } < 1/\rho_0$ , so this is  $< \rho_0 \rho / \rho_0$  to the power  $n$  for sufficiently large, okay for  $n \geq n_0$ , from here we are getting this inequality. So in view of  $\lim_{n \rightarrow \infty}$  should  $\text{mod of } C_n z \text{ to the power } 1/n = R$  we get this inequality.

Now since  $\rho/\rho_0 \text{ is } < 1$  the geometric series  $\sum_{n=1}^{\infty} \rho/\rho_0 \text{ to the power } n$ , okay. This is convergent and hence by Weierstrass M-test the series in 1 is uniformly convergent, okay. So this series converges uniformly in  $\text{mod of } z - z_0 \leq \rho < r$ . Since every term of the series 1 is analytic we can see that every term of the power series  $\sum C_n z - z_0 \text{ to the power } n$  is analytic so the sum function of the series is analytic in  $\text{mod of } z - z_0 \leq \rho$  and  $\rho < R$ .

Further, the derivative of the sum function can be obtained by term by term differentiation. Hence, if  $f_z = \sum_{n=0}^{\infty} C_n z - z_0 \text{ to the power } n$  and  $\text{mod of } z - z_0 \leq \rho < r$ .

**(Refer Slide Time: 12:07)**

Then

$$f'(z) = \sum_{n=1}^{\infty} n c_n (z - z_0)^{n-1}, |z - z_0| \leq \rho < R.$$

$\lim_{n \rightarrow \infty} |n c_n|^{1/n} = \left( \lim_{n \rightarrow \infty} n^{1/n} \right) \left( \lim_{n \rightarrow \infty} |c_n|^{1/n} \right) = 1 \cdot \frac{1}{R}$

Since  $\lim_{n \rightarrow \infty} n^{1/n} = 1$ , it follows that the radius of convergence of the derived series is also  $R$ .

#### Example 5

Let

$$\sum_{n=1}^{\infty} n^n z^n = z + 2^2 z^2 + 3^3 z^3 + \dots$$

$c_n = n^n$   
 $\frac{1}{R} = \lim_{n \rightarrow \infty} |c_n|^{1/n} = \lim_{n \rightarrow \infty} (n^n)^{1/n} = \lim_{n \rightarrow \infty} n = \infty$   
 $\Rightarrow R = 0$

Then  $R = 0$ . ✓

Then  $f'_z$  will be equal to  $\sum_{n=1}^{\infty} n c_n (z - z_0)^{n-1}$ . And here you can see the coefficient of  $z - z_0$  to the power  $n-1$  is  $n c_n$ . So limit  $n$  tends to infinity and  $c_n$  raise to the power  $1/n$  = limit  $n$  tends to infinity  $n$  to the power  $1/n$  \* limit  $n$  tends to infinity mod of  $c_n$  to the power  $1/n$ .

Now  $n$  to the power  $1/n$  as  $n$  goes to infinity is  $= 1$  so  $1 \cdot 1/R$ , okay. So you can see that the coefficient of  $z - z_0$  to the power  $n-1$  is  $n c_n$  and when we take the limit of mod of  $n c_n$  to the power  $1/n$  we get  $1/R$ , so this means that the radius of convergence of the derived series is also  $R$ , okay. And this follows from the said that, limit  $n$  tends to infinity  $n$  to the power  $1/n = 1$ , so radius of convergence of the derived series also  $R$ .

Now let us consider an example say,  $\sum_{n=1}^{\infty} n^n z^n$ . So this series can be expanded as  $z + z^2 + 3^3 z^3 + \dots$ . And here we can see that  $c_n = n^n$ . So mod of  $c_n$  raise to the power  $1/n$  limit  $n$  tends to infinity  $= n$  to the power  $1/n$  whole to the power  $1/n$ , so limit  $n$  tends to infinity  $n$  which is equal to infinity and this is equal to  $1/R$ , okay. So this implies  $1/R = \infty$  and so  $R = 0$ , so radius of convergence of this series is  $R = 0$  that means that this series converges only at the point  $z = 0$  and nowhere else.

**(Refer Slide Time: 14:15)**

**Example 6**

Let  $\lim_{n \rightarrow \infty} \frac{1}{n(n+1)^{1/n}} = 1$   
 Therefore  $R=1$

$$\sum_{n=1}^{\infty} \frac{z^n}{n^2}$$

The derived series  $\sum_{n=1}^{\infty} \frac{n z^{n-1}}{n^2} = \sum_{n=1}^{\infty} \frac{z^{n-1}}{n}$   
 The coeff. of  $z^n$  is  $\frac{1}{n+1}$

Here  $R=1$ . Further more on the circle of convergence  $|z| = 1$ , the series is absolutely convergent.  
 Hence the series converges absolutely for all  $z$  in  $|z| \leq 1$ . Further the region for convergence of derived series is  $|z| \leq 1$ .

$C_n = \frac{1}{n^2}$  so  $\frac{1}{R} = \lim_{n \rightarrow \infty} |C_n|^{1/n} = \lim_{n \rightarrow \infty} \left(\frac{1}{n^2}\right)^{1/n} = \lim_{n \rightarrow \infty} \left(\frac{1}{n}\right)^{2/n} = 1$ , since  $\lim_{n \rightarrow \infty} \frac{1}{n} = 0$

$\Rightarrow R=1$   
 The given series converges absolutely for  $|z| \leq 1$ .

Now, consider  $\sum_{n=1}^{\infty} \frac{z^n}{n^2} = \sum_{n=1}^{\infty} \frac{|z|^n}{n^2}$   
 At  $z=1$ , the derived series becomes  $\sum_{n=1}^{\infty} \frac{1}{n}$  which is divergent.

If  $|z|=1$ , we get the series  $\sum_{n=1}^{\infty} \frac{1}{n^2}$  which is convergent.

Now, let us consider another example.  $\sum_{n=1}^{\infty} z^n / n^2$ . Here we can see, here  $C_n = 1/n^2$ , okay. So limit, so  $1/R = \lim_{n \rightarrow \infty} |C_n|^{1/n} = \lim_{n \rightarrow \infty} (1/n^2)^{1/n} = \lim_{n \rightarrow \infty} 1/n^{2/n} = 1$ , since  $\lim_{n \rightarrow \infty} 1/n = 0$ . So what do we get?  $R=1$ .

Hence the radius of convergence of this power series is equal to 1. And now let us see, when you take, consider the series of absolute terms. Now consider,  $\sum_{n=1}^{\infty} |z|^n / n^2$ . So this is  $\sum_{n=1}^{\infty} |z|^n / n^2$ . Now if you take  $|z|=1$ , so if  $|z|=1$  what we get the series  $\sum_{n=1}^{\infty} 1/n^2$ , okay which is known to be convergent series, okay so convergent. It is a convergent series.

And there the given series convergent is absolutely for  $|z| \leq 1$ . For  $|z| < 1$  it converges because its radius of convergence is  $R=1$ , okay. So the given series converges absolutely for  $|z| \leq 1$ . Now let us consider the derived series. The derived series is  $\sum_{n=1}^{\infty} z^{n-1} / n$ . Now here again, if you take the coefficient  $C_n$ , okay. The coefficient  $C_n$  is the coefficient of  $z$  to the power  $n$ , the coefficient of  $z$  to the power  $n$  is  $1/n+1$ , okay.

So limit  $n$  tends to infinity, mod of  $C_n$  raise to the power  $1/n = \lim_{n \rightarrow \infty} 1/n+1$  raise to the power  $1/n$ , okay. And if you find this limit it is  $\lim_{n \rightarrow \infty} 1/n$  to the power  $1/n$   $1+1/n$  to the power  $1/n$ , okay. So when  $n$  goes to infinity this goes to 1, okay. When this goes to infinity it goes to 1 because  $n$  to the power  $1/n$  goes to 1 and  $1+1/n$  to the power  $n$  also goes to 1.

So this is 1 and therefore  $R=1$ , because this is  $1/R$ ,  $1/R=$  this. So  $R=1$ , okay and therefore the series, derived series, okay also converges for mod of  $z < 1$ . It converges absolutely for mod of  $z < 1$ . But if you take  $z=1$  what do we get? At  $z=1$ , the derived series becomes  $\sum_{n=1}^{\infty} 1/n$ , okay which is a divergent series. So the derived series, okay converges absolutely for mod of  $z < 1$ .

**(Refer Slide Time: 19:45)**

#### Theorem 7 (Cauchy-Hadamard formula)

*The radius of convergence of the power series*

$$\sum_{n=0}^{\infty} c_n (z - z_0)^n$$

is

$$R = \frac{1}{\limsup_{n \rightarrow \infty} |c_n|^{1/n}}$$

Now, let us consider the case where the limit of mod of  $C_n$  to the power  $1/n$  as  $n$  goes to infinity does not exist, okay so there we use Cauchy-Hadamard formula. The radius of convergence of the power series  $\sum_{n=0}^{\infty} C_n z - z_0$  to the power  $n$  is  $R=1/\limsup_{n \rightarrow \infty} \text{mod of } C_n \text{ to the power } 1/n$ . So let us see how we prove this.

**(Refer Slide Time: 20:13)**

**Proof**

Let

$$R = \frac{1}{\overline{\lim}_{n \rightarrow \infty} |c_n|^{\frac{1}{n}}} \in [0, \infty).$$

If  $R < \infty$ , choose any  $r > R$ . Then

$$\overline{\lim}_{n \rightarrow \infty} |c_n|^{\frac{1}{n}} > \frac{1}{r}$$

and so  $|c_n| r^n > 1$ , for infinitely many indices  $n$ . Hence  $c_n(z - z_0)^n$  does not approach zero for any  $z$  with  $|z - z_0| = r > R$ . So the power series diverges for any  $z$  with  $|z - z_0| > R$ . If  $R > 0$ , choose  $0 < r < R$ , then

$$\overline{\lim}_{n \rightarrow \infty} |c_n|^{\frac{1}{n}} < \frac{1}{r}$$

IT ROBINSON  
NPTEL ONLINE  
CERTIFICATION COURSE

11

So let us assume that  $R = 1/\limsup_{n \rightarrow \infty} |c_n|^{1/n}$ , we shall so that  $R$  is the radius of convergence of the power series  $\sum c_n(z - z_0)^n$ . Now, since  $|c_n|^{1/n} \geq 0$ , limit superior will always be  $\geq 0$ , so if it is infinity  $1/\infty$  will become 0, so this  $R$  will belong to this limit, limit superior  $n$  tends to infinity of a sequence of non-negative real numbers will always be non-negative.

So  $R$  will always be non-negative and moreover if this limit is infinite  $1/\infty$  will become 0 so this  $R$  will belong to this semi-closed interval  $[0, \infty)$ , it is  $R$  is always  $\geq 0$ . Now, first we discuss the case when  $R$  is  $< \infty$ . So if  $R < \infty$  let us choose any  $r > R$ , okay. Let us take if  $R$  is  $< \infty$  let us take any  $r > R$  then limit superior mod of  $C_n$  limit superior  $n$  tends to infinity mod of  $C_n$  to the power  $1/n$  will be  $> 1/r$  okay.

Limit superior  $n$  tends to infinity mod of  $C_n$  to the power  $1/n = 1/R$  but  $1/R$  is  $> 1/r$ , okay. So mod of  $C_n$  to the power  $1/n \cdot r > 1$  for infinitely when it says  $n$  or we can mod of  $C_n \cdot r$  to the power  $n > 1$  for infinitely many indices  $n$ . Hence  $C_n(z - z_0)^n$  does not approach 0, this is  $n$ th term of the series, okay  $n$ th terms of the power series does not approach 0, for any big mod of  $z - z_0 = R$ ,  $R > R$ . Because if the series convergent then the  $n$ th term must to go 0.

Here what is happening is mod of  $C_n R$  to the power  $n > 1$  for infinitely many indices and therefore  $C_n$  mod  $z - z_0$  to the power  $n$  okay, does not approach 0 for any  $z$  with mod of  $z - z_0 =$

$R$  where  $R$  is  $> R$ . So the power series diverges for any  $z$  with  $\text{mod of } z - z_0 > \text{capital } R$ . If  $R$  is  $> 0$ , choose  $0 < R < \text{capital } R$ , okay.

Then, if  $R$  is strictly  $> 0$  then choose  $0 < r < R$  then limit superior  $n$  tends to infinity  $\text{mod of } C_n$  to the power  $1/n$  is  $< 1/R$ , okay. So this follows from, this is limit superior  $n$  tends to the infinity,  $\text{mod of } C_n$  power  $1/n = 1/R$  but  $1/R$  is  $< 1/r$ , okay.

**(Refer Slide Time: 23:01)**

**Proof cont...**

and so  $|c_n| r^n < 1$ , for all but finitely many indices  $n$ . Hence for any  $z$  with  $|z - z_0| < r$ , we have

$$\sum_{n=0}^{\infty} |c_n| (z - z_0)^n = \sum_{n=0}^{\infty} |c_n| r^n \left| \frac{z - z_0}{r} \right|^n \leq M \sum_{n=0}^{\infty} \left| \frac{z - z_0}{r} \right|^n < \infty$$

Thus, the power series converges for any  $z$  with  $|z - z_0| < R$ . Hence, it follows that the radius of convergence is  $R$ .

The sum function of a power series is said to be represented by the power series within its circle of convergence. This raises the question whether a function can be represented by two different power series with the same circle of convergence. The following theorem answers this question;

12

So if; and so  $\text{mod of } C_n * r$  to the power  $n$  is  $< 1$ . From here it follow that,  $\text{mod of } C_n * r$  to the power  $n$  is  $< 1$  for all but finitely many indices  $n$ . And hence for any  $z$ , the  $\text{mod of } z - z_0 < r$  we have  $\sum_{n=0}^{\infty} \text{mod of } C_n z \text{ mod of } z - z_0 \text{ to the power } n = \sum_{n=0}^{\infty} \text{mod of } C_n * r \text{ to the power } n \text{ mod of } z - z_0 \text{ over } r \text{ to the power } n$  which is  $\leq m$  times. Because  $\text{mod of } C_n * r$  to the power  $n$  is  $< 1$  for all but finitely 1 indices  $n$ .

So we can say that,  $\text{mod of } C_n * r$  power  $n$  can be  $\leq m$  for all indices  $n$ , so this is  $\leq m$ ,  $\sum_{n=0}^{\infty} \text{mod of } z - z_0 r \text{ to the power } n$  which is  $< \infty$  because  $\text{mod of } z - z_0$  is over  $\text{mod of } z - z_0$  is  $< r$ , okay  $\text{mod of } z - z_0$  is  $< r$ , okay. So this is a convergent series and therefore this is  $< \infty$  that the power series converges for any  $z$  big  $\text{mod of } z - z_0 < r$ . And hence it follows that the radius of convergence of the power series is  $R$ .

The sum function of a power series set to be represented by the power series within its circle of convergence. This raises the question whether a function can be represented by two different power series with the same circle of convergence. Now the following theorem answers this question.

(Refer Slide Time: 24:44)

**Theorem 8 (Identity theorem of power series)**

If  $\sum_{n=0}^{\infty} c_n(z-z_0)^n$  and  $\sum_{n=0}^{\infty} d_n(z-z_0)^n$  are both convergent for  $|z-z_0| < R$  where  $R > 0$ , and have the same sum for every  $z$  in the circle of convergence, then the two series are identical, i.e.  $c_n = d_n, \forall n = 0, 1, 2, 3, \dots$   $f(z) = \sum_{n=0}^{\infty} c_n(z-z_0)^n$

**Proof.**

We have,  $c_{m+1} + c_{m+2}(z-z_0) + c_{m+3}(z-z_0)^2 + \dots = d_{m+1} + d_{m+2}(z-z_0) + d_{m+3}(z-z_0)^2 + \dots$   $f(z)$  is analytic for  $|z-z_0| < R$

$$c_0 + c_1(z-z_0) + c_2(z-z_0)^2 + \dots = d_0 + d_1(z-z_0) + d_2(z-z_0)^2 + \dots, |z-z_0| < R \quad (2)$$

Since the sum function is continuous for every  $z$  in  $|z-z_0| < R$ , we have  $c_0 = d_0$  as  $z$  becomes  $z_0$ . Now, let  $c_n = d_n$ , for  $n=0, 1, 2, 3, \dots, m$ . Then by omitting the first  $(m+1)$  terms on both sides of (2) and dividing by  $(z-z_0)^{m+1}$ , we obtain  $\lim_{z \rightarrow z_0} \frac{f(z) - \sum_{n=0}^m c_n(z-z_0)^n}{(z-z_0)^{m+1}} = \frac{f(z_0) - \sum_{n=0}^m c_n(z_0-z_0)^n}{0} = \frac{f(z_0) - f(z_0)}{0}$

$c_{m+1} + c_{m+2}(z-z_0) + \dots = d_{m+1} + d_{m+2}(z-z_0) + \dots$

Both these series represent a function which is continuous at  $z = z_0$ . Hence  $c_{m+1} = d_{m+1}$ . By mathematical induction, the proof is completed.  $f(z_0) = c_0$  □

So if  $\sum_{n=0}^{\infty} C_n z - z_0$  to the power  $n$  and  $\sum_{n=0}^{\infty} D_n z - z_0$  to the power  $n$  are both convergent series for  $\text{mod of } z - z_0 < r$  where  $r$  is  $> 0$  and have the same sum for every  $z$  in the circle of convergence then the two series are identical. If there are two power series which are both convergent in the same region of convergence and have the same sum for every  $z$  in that, in the circle of convergence then the two series must be identical, that is  $C_n = D_n$  for all  $n$ , this is called the Identity theorem for power series.

Now, so here what is happening is that this series, this series both the same sum therefore  $C_0 + c_1 z - z_0 + c_2 z - z_0$  whole square  $= d_0 + d_1 z - z_0; d_2 z - z_0$  whole square and so on and they converge both in the region  $\text{mod of } z - z_0 < r$ . Now, since the sum function of both the series is, since they have the same sum, okay and sum function is analytic in the region  $\text{mod of } z - z_0 < r$  and therefore the sum function is continuous for every  $z$  in  $\text{mod of } z - z_0 < r$ .

And therefore, if the sum of the series is say  $f(z)$ . Say,  $f(z) = \sum_{n=0}^{\infty} C_n z - z_0$  to the power  $n$  then  $f(z)$  is analytic in  $\text{mod of } z - z_0 < r$ , okay. And  $f(z)$  is analytic means  $f(z)$  is

continuous, okay. So continuity  $f(z)$  implies that  $\lim_{z \rightarrow z_0} f(z) = f(z_0)$ . So when  $z$  tends to  $z_0$ , okay when  $z$  tends to  $z_0$   $f(z)$  must be equal to  $f(z_0)$ . And  $f(z_0)$  is equal to here is  $C_0$ , okay.

If this is  $g(z)$ , if this is  $g(z)$  then  $\lim_{z \rightarrow z_0} g(z) = g(z_0)$ ; so again by the same argument  $g(z)$  is analytic in the region  $\text{mod of } z - z_0 < r$  so  $\lim_{z \rightarrow z_0} g(z) = g(z_0)$ , okay. So when  $z$  tends to  $z_0$  okay the left hand side tends to  $C_0$ , the right hand side tends to  $d_0$  and so  $C_0$  must be equal to  $d_0$  okay by the continuity of the sum function. Now let us assume that  $C_n = D_n$  we are going to prove that  $C_0 = d_0$   $c_1 = d_1$ ;  $c_2 = d_2$  and so on. So let us assume that  $C_n = D_n$  for  $n=1,2,3$  and so on up to  $m$

Then we shall show that  $C_n = D_n$  for  $n=m+1$  also. So then by omitting so when  $C_0 = d_0$ ;  $c_1 = d_1$ ;  $c_2 = d_2$  and  $c_m = d_m$  then we can omit the  $m$  terms from both the sides, so by omitting the first  $m+1$  terms,  $m+1$  terms on both sides of this equation 2, what we will have, we will have  $c_{m+1} z - z_0$  to the power  $m+1+c_{m+2} z - z_0$  to the power  $m+2$  and so on equal to  $d_{m+1} z - z_0$  to the power  $m+1+d_{m+2} z - z_0$  to the power  $m+2$  and so on, okay. So by omitting the first  $m+1$  terms on both the sides the series reduces to this equation.

And then we can divide by  $z - z_0$  to the power  $m+1$ . So when we divided by  $z - z_0$  to the power  $m+1$  what we will get, we will get  $c_{m+1} + c_{m+2} z - z_0$ , okay,  $c_{m+1} + c_{m+2} z - z_0$   $c_{m+3} z - z_0$  whole square and so on equal to  $d_{m+1} + d_{m+2} z - z_0$   $d_{m+3} z - z_0$  whole square and so on, okay. So we obtained this one, this series. Now both these series represent a function which is continuous at  $z=z_0$ .

Because when we remove the terms still the series represents analytic function, this series represent a analytic function, this also represent analytic function, so they are continuous functions at  $z=z_0$  n. And therefore,  $c_{m+1}$  must be equal to  $d_{m+1}$  as  $z$  tends to  $z_0$ , this will tend to  $c_{m+1}$  and  $z$  tends to  $z_0$  this will tend to  $d_{m+1}$  and they are continuous so at  $z=z_0$  they must be equal to  $c_{m+1}$  and  $d_{m+1}$ . So this is  $c_{m+1}$  and this is  $d_{m+1}$ .

So  $c_{m+1}$  must be equal to  $d_{m+1}$  and therefore, by mathematical induction the theorem is proved.

Note

Two power series may be multiplied term-by-term and rearranged in any desired order throughout the region lying in the interior of any common region of convergence. This is due to the fact that both the series are absolutely convergent in the common region of convergence.

Now two power series maybe multiplied by term-by-term or rearranged in any desired order throughout the region lying in the interior. Thereof any common region of convergence because the both the series are absolutely convergent in the common region of convergence. With this, I would like to end my lecture. Thank you very much for your attention.
