**Lecture – 32**  
**Application of Conformal Mappings to Potential Theory**

Hello friends. Welcome to my lecture on application of conformal mappings to potential theory. Suppose that  $D$  is a domain in the  $z$ -plane and that  $g$  is a function defined on the boundary  $C$  of  $D$ . Let us say we have a region  $D$  in the  $z$ -plane, okay.

**(Refer Slide Time: 00:47)**

**Application of conformal mapping**

Suppose that  $D$  is a domain in the  $z$ -plane and that  $g$  is a function defined on the boundary  $C$  of  $D$ . The problem of finding a function  $\phi(x, y)$  that satisfies Laplace's equation

$$\Delta^2 \phi = 0 \text{ or } \frac{\partial^2 \phi}{\partial x^2} + \frac{\partial^2 \phi}{\partial y^2} = 0 \text{ in } D$$

and that equals to  $g$  on the boundary of  $D$ , is called a Dirichlet problem:

 IIT ROORKEE

 NPTEL ONLINE  
CERTIFICATION COURSE

2

And  $C$  is its boundary, okay. So let us say  $C$  is its boundary. We have to find the function  $\phi$  which satisfies the Laplace equation,  $\Delta^2 \phi = 0$  or  $\phi_{xx} + \phi_{yy} = 0$  in  $D$  and that equals to  $g$  on the boundary of  $D$ . Such a problem is known as Dirichlet problem. We will consider a Dirichlet problem and we shall solve the Dirichlet problem using the conformal mapping.

**(Refer Slide Time: 01:22)**

In order to solve the Dirichlet problem, the basic ideas involved are as follows:

- 1 Find an analytic function  $w = f(z) = u(x, y) + iv(x, y)$  which maps the domain  $D$  onto the interior of unit circle or half plane.
- 2 Use the mapping function to transform the boundary value problem for the domain  $D$  into a corresponding one for the unit circle or half plane.
- 3 Solve the problem for unit circle or half plane.
- 4 Use the solution in (3) to solve the given problem by employing the inverse mapping function.

So in order to solve the Dirichlet problem, the basic ideas involved are, we have to find an analytic function  $w=fz=uxy+ivxy$  which maps the domain  $D$  on to the interior of unit circle or half plane. And then we use the mapping function to transform the boundary value problem, given boundary value problem for the domain  $D$  into a corresponding boundary value problem for the unit circle or half plane.

We shall solve the boundary value problem for unit circle or half plane and then use the solution to obtain the solution of the given problem by employing the inverse mapping function.

(Refer Slide Time: 02:02)

#### Example 1

Find a function harmonic inside the unit circle  $|z| = 1$  and taking the prescribed values given by

$$F(\theta) = \begin{cases} 1, & 0 < \theta < \pi \\ 0, & \pi < \theta < 2\pi \end{cases}$$

on its circumference.

#### Solution

Let us map the interior of the circle  $|z| = 1$  onto the upper half of the  $w$ -plane. We know that

$$w = e^{i\theta} \left( \frac{z - \alpha}{z - \bar{\alpha}} \right),$$

where  $\text{Im}(\alpha) > 0$  maps the upper half of the  $z$ -plane onto the disk  $|w| \leq 1$ .

Now let us take example 1 where we have to find function which is harmonic inside the unit

circle mod of  $z=1$  and takes the prescribed values given by  $F(\theta)=1$  when  $\theta$  lies between  $0$  and  $\pi$  and  $0$  when  $\theta$  lies between  $\pi$  and  $2\pi$  on its circumference. So let us map the interior of the circle mod of  $z=1$  on to the upper half of the  $w$  plane, okay. So we have, this is your circle mod of  $z=1$  in the  $z$  plane and we have to map it to upper half of the  $w$  plane, okay.

Now so this is what we will do first. We know that  $w=e^{i\theta} z^{-\alpha}/z^{-\alpha}$  conjugate maps the upper half of the  $z$  plane on to the disc in the  $w$  plane. If this is your upper half plane, then it maps this upper half plane into mod of  $w$  less than or equal to  $1$ , okay, if  $w$  is given by  $e^{i\theta} z^{-\alpha}/z^{-\alpha}$  conjugate, where imaginary part of  $\alpha > 0$ . So this maps upper half of  $z$  plane on to the disc mod of  $w$  less than or equal to  $1$ .

This we have discussed earlier. So we are using this transformation. Now here we have circle in the  $z$  plane and upper half plane in the  $w$  plane. So this will interchange  $z$  and  $w$  here to get the required mapping. So let us first consider a particular bilinear transformation which maps the upper half of the  $z$  plane on to the disc mod of  $w$  is less than or equal to  $1$ . Then we shall interchange  $z$  and  $w$  to arrive at the transformation which will map the region mod of  $z$  less than or equal to  $1$  on to the upper half of the  $w$  plane.

So let us first consider a particular value say  $\alpha$ .  $\alpha$  is such that imaginary part of  $\alpha > 0$ .

**(Refer Slide Time: 04:25)**

Let us take  $\alpha = i$ , then  $\text{Im}(\alpha) = 1 > 0$ . In order to determine  $\theta_0$ , let us map  $z = 0$  onto  $w = 1$ . Then  $\theta_0 = \pi$ .  
Hence

$$w = \left( \frac{i - z}{z + i} \right) \quad (1)$$

We are given circle in the  $z$ -plane and upper half in the  $w$ -plane so let us interchange  $z$  and  $w$  in (1) then

$$w = \frac{i - z}{z + i} \Rightarrow z = \frac{i - w}{1 + w}$$

$$\Rightarrow w = i \left( \frac{1 - z}{1 + z} \right)$$

$\text{Im}(i) = 1$   
 $w = e^{i\theta_0} \left( \frac{1 - z}{1 + z} \right)$   
 $1 = e^{i\theta_0} \left( \frac{1 - z}{1 + z} \right) \Rightarrow e^{i\theta_0} = 1$   
 $\theta_0 = \pi$

5

So I take  $\alpha=i$ . Then imaginary part of  $\alpha=1$ . So imaginary part of  $\alpha=1>0$ . So then the transformation becomes  $w=e^{i\theta} \frac{z-i}{z+i}$ .  $i$  conjugate is  $-i$ , so  $z-i/z+i$ , okay. Now what we do? Let us map; now in order to determine this  $\theta$ , we take a point on the boundary, the boundary is the real axis here. So let us take the point to be  $z=0$  and we have to map it to a point on the boundary of the region here in this case, that is  $\text{mod of } w=1$ .

So that I take as  $w=1$ . So that point is here,  $w=1$ . So let us map  $z=0$  to  $w=1$ , what we get?  $1=e^{i\theta}$  to the power  $i\theta$ , then we have  $-i/i$ . So we get here  $e^{i\theta} = -1$ , that means  $\theta=\pi$ , okay. So then what will happen?  $w$  will be equal to  $e^{i\theta}$  is  $-1$ , so  $-z-i/z+i$  and we get  $i-z/z+i$ . So this transformation maps the upper half of the  $z$  plane on to the disc  $\text{mod of } w \leq 1$ .

Now as I said earlier, here we have the region circle in the  $z$  plane and upper half plane in the  $w$  plane, so we have to interchange  $z$  and  $w$  here. So let us interchange  $z$  and  $w$  in this mapping, okay. So then we get  $z=i-w/i+w$  and when we simplify this, for  $w$ , we get  $w=i(1-z)/1+z$ . So this transformation now maps the disc  $\text{mod of } z \leq 1$  on to the plane  $\text{Im } w \geq 0$ .

**(Refer Slide Time: 06:41)**

Now under this transformation, the arcs  $ABC$  and  $CDE$ , okay, so what we have now, let us see we have  $w=i(1-z)/1+z$ , okay. So under this transformation, the  $\text{mod of } z \leq 1$  is

mapped to  $v$  greater than or equal to 0, okay. Boundary mod of  $z=1$  is mapped to the boundary here, that is  $v=0$ . Now let us see which part of the circle maps to which part of the boundary here, that is  $v=0$ .

So we notice that ABC, if you look at ABC, the arc ABC, the arc ABC at the point  $v$  we have  $z=-i$ , okay. Let us see where this  $v$  goes? So when you put  $z=-i$  here, what do you get?  $w=i \cdot 1-i/1+i$ , okay. We have  $z=-i$ , so this will be  $-i$  here. So this will be, okay and this will be  $-$ , okay. Now what we have?  $i-1/1-i$  which is equal to  $-1$ . So this  $v$  goes to  $v$  dash, okay. This  $v$  dash is  $-1$ , okay.

And at C, what you have?  $z=0$ . If you put  $z=0$ , what you get? No, at C,  $z=1$ , okay. At C,  $z=1$ , so what comes here?  $w=i \cdot 1$ , okay,  $z=1$  means  $1-1/1+1$ . So this is equal to 0. So this is mapped with, the C is mapped to C dash, the origin of the  $w$  plane. This means that the lower arc ABC, the point A here. The point A goes to A dash that is infinity, okay. The point A goes to; at the point A,  $z=-1$ , okay,  $z$  goes to  $w=\infty$ , so A goes to A dash.

So ABC is mapped to A dash B dash C dash and CDE is mapped to C dash D dash E dash. We can easily check that D goes to D dash by putting the value of D, the complex number representing D point is  $z=i$ , so you put  $z=i$  here, you get this  $w=1$  here. So this D is mapped to D dash. And E again goes to infinity, so E dash. So ABC is mapped to A dash B dash C dash. And CDE is mapped to C dash D dash E dash of the  $w$  plane.

**(Refer Slide Time: 09:46)**

We are given that  $\phi = 0$  on arc  $ABC$  and  $\phi = 1$  on arc  $CDE$ . Hence  $\phi = 0$  on  $A'B'C'$  and  $\phi = 1$  on  $C'D'E'$ . Now, we have to find a function  $\phi$  which is harmonic in the upper half of  $w$ -plane and taking the values 0 for  $u < 0$  and 1 for  $u > 0$ . Thus, the problem is to solve the PDE

$$\phi_{uu} + \phi_{vv} = 0, \quad v > 0$$

Now we are given that  $\phi=0$  on arc  $ABC$ . We are given that; we can see that. We are given that  $\phi=0$  when  $\theta>0$  but less than  $\pi$ , that is on the upper arc and when  $\theta$  varies from  $\pi$  to  $2\pi$ , it is 0. So we have  $\phi=0$  on the arc  $ABC$ , okay, on this arc. This we have  $\theta$  varies from  $\pi$  to  $2\pi$ . So  $\phi$  is 0 on the arc  $ABC$ .  $ABC$  is mapped to  $A \text{ dash } B \text{ dash } C \text{ dash}$ . So  $\phi$  is 0 here on the side negative real axis of the  $w$  plane and this one,  $CDE$ , okay.

On  $CDE$ ,  $\phi=1$ . So it is  $\phi=1$  on the positive  $u$  axis of the  $w$  plane, okay. So  $\phi=0$  on  $A \text{ dash } B \text{ dash } C \text{ dash}$  and  $\phi=1$  on  $C \text{ dash } D \text{ dash } E \text{ dash}$ . Now we have to find a function  $\phi$  which is harmonic in the upper half of  $w$  plane and taking the value 0 for  $u<0$ , that is negative  $u$  axis and 1 for positive  $u$  axis. Thus the problem is to solve the Laplace equation  $\phi_{uu}+\phi_{vv}=0$ , where  $v>0$ .  $v>0$  represents the upper half of the  $w$  plane.

**(Refer Slide Time: 11:05)**

$$\lim_{v \rightarrow 0^+} \phi(u, v) = G(u) = \begin{cases} 1, & u > 0 \\ 0, & u < 0 \end{cases}$$

which is a Dirichlet problem for the upper half plane.

Consider the function  $A \ln w + B$  where  $A$  and  $B \in \mathbb{R}$ . Then

$$A \ln w + B = A \ln(Re^{i\theta}) + B = (A \ln R + B) + i(A\theta + B)$$

where  $w = Re^{i\theta}$  then  $A\theta + B$  is a harmonic function since it is the imaginary part of the analytic function  $A \ln w + B$ .

Now and the condition on  $\phi(u, v)$  is that when  $v$  goes to 0,  $\phi(u, v) = G(u)$  and  $G(u)$  is 1 when  $u > 0$  on the right half, positive  $u$  axis.  $G(u)$  should take value 1 and  $G(u)$  should be 0 when  $u < 0$ . Now this is the Dirichlet problem for the upper half of the  $w$  plane. Now consider the function  $A \ln w + B$ , okay. Consider this function  $A \ln w + B$  where  $A, B$  belong to  $\mathbb{R}$ . Then  $A \ln w + B$  is  $A \ln Re^{i\theta} + B$ . Let us put  $w = Re^{i\theta}$ .

So  $A \ln Re^{i\theta} + B$  which is  $A \ln R + B + iA\theta$ . Now  $A \ln w + B$  we know is an analytic function, okay. So its real and imaginary parts are harmonic functions. And therefore,  $A\theta + B$  which is imaginary part of  $A \ln w + B$  is a harmonic function. So  $A\theta + B$  is a harmonic function as it is the imaginary part of the analytic function  $A \ln w + B$ , okay.

**(Refer Slide Time: 12:09)**

Let us take  $\phi = A\theta + B$  then  $\phi = 1$  for  $u > 0$  i.e.  $\theta = 0$  and  $\phi = 0$  for  $u < 0$  i.e.  $\theta = \pi$ .

Thus  $B = 1, A = \frac{-1}{\pi}$ .

Hence

$$\phi = 1 - \frac{\theta}{\pi} = 1 - \frac{1}{\pi} \tan^{-1} \frac{v}{u}$$

Now, from  $w = i \left( \frac{1-z}{1+z} \right)$ , we have

$$u = \frac{2y}{(1+x)^2 + y^2}, \quad v = \frac{1 - (x^2 + y^2)}{(1+x)^2 + y^2}$$

Hence

$$\phi = 1 - \frac{1}{\pi} \tan^{-1} \left( \frac{1 - r^2}{2r \sin \theta} \right)$$

Handwritten notes on the right side of the slide:

$1 = A(0) + B \Rightarrow 0 = 1$   
 $0 = A\pi + 1 \Rightarrow A = -\frac{1}{\pi}$   
 $w = Re^{i\theta}$   
 $u = R \cos \theta$   
 $v = R \sin \theta$   
 $\Rightarrow \theta = \tan^{-1} \frac{v}{u}$   
 $\phi = 1 - \frac{1}{\pi} \tan^{-1} \frac{1 - x^2 - y^2}{2y}$   
 $\Rightarrow \phi = 1 - \frac{1}{\pi} \tan^{-1} \frac{1 - r^2}{2r \sin \theta}$

Page number 9

Now let us take  $\phi = A\theta + B$ . So as we said earlier  $A\theta + B$  is harmonic because it is the imaginary part of  $A \ln w + B$ . So let us take  $\phi = A\theta + B$ , then  $\phi$  is harmonic and let us put the condition on  $\phi$  that  $\phi = 1$  for  $u > 0$  and  $u > 0$  means  $\theta = 0$  because we are writing  $w$  as  $Re^{i\theta}$ , okay. So  $\theta = 0$  gives you positive  $u$  axis. So that is  $\theta = 0$  and  $\phi = 0$  for  $u < 0$  meaning thereby  $\theta = \pi$ , negative  $u$  axis.

Now if you do that, then what you will get?  $\phi = 1$  when  $\theta = 0$ , okay. So  $A \cdot 0 + B$ , so we get  $B = 1$ , okay. So this condition gives you  $B = 1$  and then  $\phi = 0$  when  $\theta = \pi$ . So  $A \pi + 1$ , okay,  $B$  is 1. So this gives you  $A = -1/\pi$ , okay. So we get the values of  $A$  and  $B$  both. So  $\phi = 1 - \theta/\pi$  from here, okay. And  $\theta$ , because  $w = Re^{i\theta}$  to the power  $i\theta$ , we have put. So  $u = R \cos \theta$  and  $v = R \sin \theta$ .

So this gives you  $\theta = \tan^{-1} v/u$ , okay. Now we have the transformation  $w = i \cdot \frac{1-z}{1+z}$ , this transformation. So from here, let us find the value of  $u$  and  $v$ , okay. So you put  $w = u + iv$   $z = x + iy$ , then simplify this and equate the real and imaginary parts, we get  $u = \frac{2y}{1+x^2+y^2}$  and  $v = \frac{1-x^2-y^2}{1+x^2+y^2}$ .

So  $v/u$  will give you  $\phi$  as  $1 - \frac{1}{\pi} \tan^{-1} \frac{1-x^2-y^2}{2y}$ , so  $1-x^2-y^2$  over  $2y$ , means  $2y$ , okay. Now let us convert this to polar coordinates. So let us take  $x = r \cos \theta$   $y = r \sin \theta$ . So this will give you  $\phi = 1 - \frac{1}{\pi} \tan^{-1} \frac{1-r^2}{2r \sin \theta}$ , where  $x$  is  $r \cos \theta$ ,  $y$

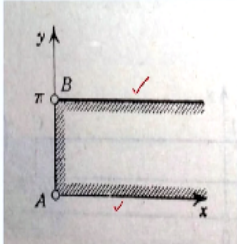

is  $r \sin \theta$ . So this is the solution of the given problem.

(Refer Slide Time: 15:11)

**Example 2**  
Find the image of the semi-infinite strip

$$x \geq 0, 0 \leq y \leq \pi$$

under the mapping  $w = \cosh z$ .

ET ROOPEX NPTEL ONLINE CERTIFICATION COURSE 10

Let us take another example. Let us find the image of the semi-infinite strip. We are given the semi-infinite strip which is defined by the inequalities  $x$  greater than or equal to 0 and  $y$  varies from 0 to  $\pi$ , okay under the mapping  $w = \cosh z$ .

(Refer Slide Time: 15:29)

Find the temperature  $T(x, y)$  in the strip considered in the above example, if the temperature on the boundary is

$$T = T_0, \text{ on the segment from } 0 \text{ to } \pi i$$

$$T = 0, \text{ on the upper and lower boundaries.}$$

ET ROOPEX NPTEL ONLINE CERTIFICATION COURSE 11

And the next, the second part of the problem is that we have to find the temperature  $T(x, y)$  in the strip considered here, okay if the temperature on the boundary is  $T = T_0$  on the segment from 0 to  $\pi i$ . So on this segment, okay, on the segment AB, temperature is given by  $T = T_0$  while temperature is 0 along this  $x$  axis and temperature 0 along the line this  $y = \pi$   $x$  greater than or

equal to 0.

So this boundary and this boundary, okay. On this boundary and this boundary, temperature is 0 while here the temperature is  $T_0$ , okay. So first let us see what is the image of this semi-infinite strip region bounded by the semi-infinite strip under the mapping  $w = \cosh z$ . Then we will take up the second part of the problem, okay.

(Refer Slide Time: 16:21)

**Solution**

Let  $w = u + iv$ . The positive  $x$ -axis is mapped onto the portion  $u \geq 1$  of the  $u$ -axis.

The left boundary of the strip is mapped onto the segment  $1 \geq u \geq -1$

of the  $u$ -axis.

The upper boundary of the strip is mapped onto the portion  $u \leq -1$

of the  $u$ -axis.

Thus, the boundary of the strip is mapped onto the  $u$ -axis.

*Handwritten notes:*

$w = \cosh z$   
 $z = x$  along positive  $x$ -axis  
 Hence  $w = \cosh x = u + iv$   
 $\Rightarrow u = \frac{e^x + e^{-x}}{2}$   
 $\frac{du}{dx} = \frac{e^x - e^{-x}}{2}$   
 $= \frac{e^x - 1}{2e^x}$   
 $= \frac{1 - e^{-x}}{2}$   
 Along  $u$ -axis  
 So  $w = \cosh(x + iy) = \cosh x \cos y + i \sinh x \sin y$   
 $= \cosh x \cos y$

So let us say  $w = u + iv$ , okay. So first let us see where this positive  $x$  axis, this part, okay is mapped under the mapping  $w = \cosh z$ , okay. So  $w = \cosh z$ , okay, when we are looking at the image of the positive  $x$  axis, positive  $x$  axis means  $y = 0$ , so  $z = x$ , okay along positive  $x$  axis. And hence  $w$  will be equal to  $\cosh x$ , okay. Now  $x$  is greater than or equal to 0 along the positive  $x$  axis.

And so  $\cosh x$  is  $e^x + e^{-x}$  over 2, okay. When  $x$  is greater than or equal to 0, it is greater than or equal to 1, okay. And moreover,  $\cosh x$  is a real quantity, so if you put  $w = u + iv$ , then  $u = \cosh x$  or you can say  $u = \frac{e^x + e^{-x}}{2}$ . So it is always greater than or equal to 1 for all  $x$  greater than or equal to 0, okay. And moreover, you can see  $du/dx$ ,  $du/dx$  is  $\frac{e^x - e^{-x}}{2}$ , okay.

So this gives you  $e^{2x-1/2} \cdot e^x$ . So this is greater than or equal to 0

when  $x$  is greater than or equal to 0, okay. This means that the  $u$  monotonically increases, increases monotonically as  $x$  increases. So positive  $u$  axis is mapped on to the portion  $u$  greater than or equal to 1 in the  $w$  plane.

This is your  $u$  greater than or equal to 1. So on this part, positive axis is mapped on to  $u$  greater than or equal to 1. Now let us look at the left boundary of the strip, okay. Left boundary of the strip means this segment, okay, from 0 to  $\pi$ , okay where  $y$  varies from 0 to  $\pi$ . So let us look at this segment, okay.

So along the segment  $x=0$  and 0 is less than or equal to  $y$  less than or equal to  $\pi$ , okay. Now so  $w = \cos \text{hyperbolic } z$ . So it is  $x + iy$ ,  $\cos \text{hyperbolic } z$  means  $\cos \text{hyperbolic } x + iy$ , okay,  $x=0$ , so this is  $\cos \text{hyperbolic } iy$ , okay. And  $\cos \text{hyperbolic } iy$  is  $\cos i$  of  $iy$ , okay. So  $\cos -y$  which is  $\cos y$ , okay. So  $w = \cos y$  which means that  $u = \cos y$  because  $y$  is real, so  $\cos y$  is real. So we can write.

(Refer Slide Time: 19:43)

Then  $u = \cos y$   
 $v = 0$   
 Since  $y$  varies from 0 to  $\pi$ ,  $u$  varies from -1 to 1 &  $v = 0$

Along the upper boundary  
 $x \geq 0, y = \pi$   
 $w = \cosh z = \cosh(x + i\pi) = \cosh(x + i\pi) = \cos(i\pi - x)$   
 $\Rightarrow w = \cos i\pi \cosh x + \sin i\pi \sinh x$   
 $\Rightarrow w = \cosh x \cosh i\pi + i \sinh x \sinh i\pi$   
 $u + iv = w = -\cosh x$  when  $y = \pi$   
 when  $x \geq 0$   
 then  $u = -\cosh x \leq -1$

For the interior part of the strip  
 $u + iv = w = \cosh z = \cosh x \cosh y + i \sinh x \sinh y$   
 $v = \sinh x \sinh y = \frac{(e^x - e^{-x})}{2} \sinh y$   
 $= \frac{(e^{2x} - 1)}{2e^x} \sinh y > 0$  as  $0 < y < \pi$  &  $x > 0$

The diagram shows the  $z$ -plane with the region  $0 \leq y \leq \pi, x \geq 0$  shaded. The boundary  $y = \pi$  is the upper boundary, and the boundary  $x = 0$  is the left boundary.

Then  $u = \cos y$ , okay and  $v = 0$ , okay. This now  $y$  varies from 0 to  $\pi$ , okay. So  $u = \cos y$  will vary from -1 to 1. So since  $y$  varies from 0 to  $\pi$ , okay,  $u$  varies from -1 to 1, okay. And  $v = 0$ . So that means, this part, the left boundary, okay, this left boundary, this boundary, okay, is mapped on to the segment -1 to 1, okay, on this segment, okay. When you reach the point  $\pi i$ ,  $\pi i$  here, this  $\pi i$  is mapped to this point -1, because that  $\pi i$ ,  $y = \pi$  and when  $y = \pi$ ,  $\cos \pi$  gives you -1.

And this A point is mapped on to this 1. So we get 1 greater than or equal to  $u$  greater than or equal to -1. So this -1 to 1, this, the image of the left boundary of the strip. Now let us look at the upper boundary of the strip. Upper boundary of the strip is this one, this upper boundary. So along the upper boundary, we have  $y=\pi$  and  $x$  is greater than or equal to 0, okay. So upper boundary means  $x$  is greater than or equal 0 and  $y=\pi$ , okay.

Then let us see how we get  $u$  less than or equal to -1, okay. So along the upper boundary,  $x$  is greater than or equal 0,  $y=\pi$ , okay,  $w=\cosh z$ , so we get  $\cosh(x+iy)$ . Now  $\cosh z = \cosh iz$ . So we get  $\cosh i(x+iy)$ . So this is equal to  $\cosh ix-y$ , okay. And this gives you  $w = \cosh ix \cosh y + \sinh ix \sinh y$ . And which gives you  $w = \cosh x$ ,  $\cosh ix$  is  $\cosh$  hyperbolic  $x$ .  $\cosh$  hyperbolic  $x \cosh y + \sinh ix$  is  $i \sinh$  hyperbolic  $x$ .

Now let us put the condition, this one,  $x$  greater than or equal to 0,  $y=\pi$ . So when  $y=\pi$ , what happens?  $\sinh \pi=0$ , okay. So  $w$  becomes  $-\cosh$  hyperbolic  $x$  we get when  $y=\pi$ , okay. Now we are given that  $x$  is greater than or equal to 0. So when  $x$  is greater than or equal to 0, okay,  $\cosh$  hyperbolic  $x$  is greater than or equal to 1. So  $-\cosh$  hyperbolic  $x$  is less than or equal to -1. So then, now this is  $u+iv$ .  $u+iv=-\cosh$  hyperbolic  $x$ .

But  $-\cosh$  hyperbolic  $x$  is real quantity. So  $u=-\cosh$  hyperbolic  $x$ . So then  $u$  is equal to, less than or equal to -1, okay. So the upper end boundary of the strip is mapped on to this part, okay. So this means that the boundary of the strip is mapped on to the  $u$  axis in the  $w$  plane, okay.

**(Refer Slide Time: 24:09)**

The interior of the strip is mapped onto the upper half of the  $w$ -plane.

Now let us look at the interior of the strip, okay. The interior of the strip, this one, let us see where the interior of the strip goes, okay. So we want to show that the interior of the strip is mapped on to the upper half of the  $w$  plane, okay. So for the interior part, let us see again  $w = \cosh z$ . We have seen that  $\cosh z$  gives you  $\cosh x \cos y$  and  $i \sinh x \sin y$ , okay.  $w = u + iv$ .

So this gives you  $v = \sinh x \sin y$ , okay. Now  $\sinh x$  is  $e^x - e^{-x}$  over 2. So this is  $e^x - e^{-x}$  over 2 times  $\sin y$ . So this is  $e^x - e^{-x}$  over 2 times  $\sin y$ , okay. Now let us see how the region bounded by this semi-infinite strip is defined, okay. This is your  $AB$  and this is your  $y = \pi$ , okay. So  $0 \leq y \leq \pi$  we have and  $x$  is greater than or equal to 0.

So this is how we are defining the region bounded by the strip, okay. So for interior region,  $0 < y < \pi$  and  $x > 0$ . So when  $y$  is lying between 0 and  $\pi$ ,  $\sin y$  is positive and  $x > 0$  means  $\sinh x$  is positive. So this is greater than 0, okay. As  $0 < y < \pi$  and  $x > 0$ . So this portion, okay, the region bounded by the semi-infinite strip, that is the interior part of the strip goes to  $v > 0$ . So the region bounded by the semi-infinite strip is mapped on to the upper half of the plane,  $w$  plane under the mapping  $w = \cosh z$ , okay.

**(Refer Slide Time: 26:54)**

Since  $T$  is independent of time ("steady state temp. distribution"), the heat equation reduces to the Laplace equation

$$\Delta^2 T = \frac{\partial^2 T}{\partial x^2} + \frac{\partial^2 T}{\partial y^2} = 0$$

We have to find a solution of this equation satisfying the given boundary conditions.

Now let us solve the second part of the problem, okay. The second part of the problem is that we have to find the temperature distribution in the semi-infinite strip which we have considered here, okay, the semi-infinite strip and the temperature on the boundary is given. It is  $T_0$  along the left part of the boundary and along the other 2 sides, upper and lower boundaries it is 0. So let us solve the Laplace equation  $\frac{\partial^2 T}{\partial x^2} + \frac{\partial^2 T}{\partial y^2} = 0$ .

We have to find the solution of this equation satisfying the given boundary conditions. So the boundary conditions are  $T=T_0$  on the segment from now. Under the mapping  $w=\cos$  hyperbolic  $z$ , we have seen this part, left end of the boundary, okay, left part of the boundary is mapped on to the segment -1 to 1. This is mapped on to  $u$  greater than or equal to 1. This is mapped on to  $u$  less than or equal to 1, okay.

**(Refer Slide Time: 28:02)**

The boundary conditions in the  $w$  plane are

$$T = T_0, \text{ on the segment from } -1 \text{ to } 1$$

$$T = 0, \text{ on the other parts of the } u\text{-axis.}$$

We have to find such a solution  $T(u, v)$  in the upper half of the  $w$ -plane which satisfies those boundary conditions.

So making use of that, we can say that  $T=T_0$  on the segment from  $-1$  to  $1$  and  $T=0$  on the other parts of the  $u$  axis. So we have to find a solution  $T_{uv}$  in the upper half of the  $w$  plane which satisfies those boundary conditions. Let us consider the functions  $\text{Ln } w+1$ , this is principal value of the logarithm.

(Refer Slide Time: 28:15)

Let us consider the functions

$$\text{Ln}(w+1) = \ln|w+1| + i\phi_1, \phi_1 = \arg(w+1) = \tan^{-1} \frac{v}{u+1} \checkmark$$

$$\text{Ln}(w-1) = \ln|w-1| + i\phi_2, \phi_2 = \arg(w-1) = \tan^{-1} \frac{v}{u-1} \checkmark$$

Since  $\phi_1(u, v)$  and  $\phi_2(u, v)$  are harmonic functions,  $\phi_2 - \phi_1$  is harmonic.  $\checkmark$

Handwritten notes:

- $\phi_1 = \arg(w+1)$ , no fix
- $\phi_2 = \arg(w-1)$ , no fix
- when  $u < -1$ 
  - $\phi_1 = \pi$
  - $\phi_2 = \pi$
  - $\phi_2 - \phi_1 = 0$
- when  $-1 < u < 1$ 
  - $\phi_1 = 0$
  - $\phi_2 = \pi$
  - $\phi_2 - \phi_1 = \pi$
- when  $u > 1$ 
  - $\phi_1 = 0$
  - $\phi_2 = 0$
  - $\phi_2 - \phi_1 = 0$
- when  $u < -1$  and  $u+1 < 0$ 
  - then  $\phi_2 - \phi_1 = \pi - \pi = 0$
- when  $-1 < u < 1$ 
  - $\phi_2 - \phi_1 = \pi - 0 = \pi$
  - hence  $\phi_2 - \phi_1 = 0 - 0 = 0$
- when  $u > 1$ 
  - $\arg(u+i0) = \arg(u+i0)$
  - then  $u+1 > 0$  and  $u-1 > 0$
  - then  $\phi_2 - \phi_1 = 0 - 0 = 0$

So  $\text{Ln } w+1 = \ln \text{ mod of } w+1 + i\phi_1$  where  $\phi_1$  is argument of  $w+1$  and  $w=u+iv$ , so argument of  $u+iv+1 = \arg$  of  $u+1+iv$  which is equal to  $\tan^{-1} v/u+1$ . So we get this argument. Now here  $\text{Ln } w-1$  be considered which is  $\ln \text{ mod of } w-1 + i\phi_2$  in a similar manner as in the case of  $\text{Ln } w+1$ , we get  $\phi_2 = \arg$  of  $w-1 = \tan^{-1} v/u-1$ . Since  $\phi_1$  and  $\phi_2$  are imaginary parts of this analytic function  $\text{Ln } w+1$  and  $\text{Ln } w-1$ ,  $\phi_1$  and  $\phi_2$  are harmonic functions. And when

$\phi_1$  and  $\phi_2$  are harmonic, then  $\phi_2 - \phi_1$  is also harmonic function, okay.

(Refer Slide Time: 29:21)

The function

$$T(u, v) = \frac{T_0}{\pi} (\phi_2 - \phi_1) \checkmark$$

is harmonic in the half plane  $v > 0$  and satisfies

$$T(u, v) = \begin{cases} 0, & u < -1 \\ T_0, & -1 < u < 1 \\ 0, & u > 1. \end{cases}$$

IT ROOTS  
NPTEL ONLINE CERTIFICATION COURSE

17

Now let us consider this function,  $T_{uv} = T_0/\pi (\phi_2 - \phi_1)$ , okay. Since  $\phi_2 - \phi_1$  is harmonic,  $T_{uv} = T_0/\pi (\phi_2 - \phi_1)$  is also harmonic. Now let us see when  $u < -1$ , how  $T_{uv} = 0$ , okay. So when  $u < -1$ , okay, then what happens to  $\phi_2 - \phi_1$ , okay? So  $u < -1$  means  $u+1 < 0$ , okay. So  $u+1 < 0$ , okay. This means that  $\phi_2$ , the argument of  $\phi_2$  is  $\pi$  and argument of  $\phi_1$  is also  $\pi$ , okay. So  $u+1$  is negative means  $\phi_2$  is  $\pi$  and this  $\phi_1$  is also  $\pi$ .

So we get  $\pi - \pi = 0$ . Because when  $u < -1$ ,  $u+1 < 0$  and  $u-1 < 0$ , so  $\phi_2 - \phi_1 = \pi - \pi = 0$ . And when you take  $-1 < u < 1$ , okay. So when  $u$  is lying between  $-1$  and  $1$ , okay. When  $-1 < u < 1$ , okay, then what happens?  $u+1 > 0$  while  $u-1 < 0$ , okay. So  $u+1 > 0$  means the  $\phi_2$  of  $u-1 < 0$ ,  $u-1 < 0$  means it is, okay. This is  $\phi_2$ , right. So  $\phi_2$  is, okay. So  $u-1 < 0$  means  $\phi_2$  is  $\pi$ , okay. So  $\phi_2$  is  $\pi$  and  $\phi_1 = 0$ . So  $\phi_2 - \phi_1 = \pi - 0 = \pi$ , okay.

So in this case, when  $u$  lies between  $-1$  and  $1$ ,  $\phi_2 - \phi_1 = \pi$  and when  $u > 1$ , then what will happen?  $u+1 > 0$ , when  $u > 1$ . Then  $u+1$ , okay, is greater than  $0$  and  $u-1$  is also greater than  $0$ , okay. Hence,  $\phi_2 - \phi_1$ , okay, is equal to;  $\phi_2$  means  $u-1 > 0$ , so each one is equal to  $0$ ,  $0 - 0 = 0$ , okay. Because  $u-1$  is positive,  $u+1$  is positive, so  $\phi_2 - \phi_1$  will be  $0 - 0$ , that is equal to  $0$ . This means that on the segment  $-1$  to  $1$ , we get  $\pi$ .

On the other segments, on the other portions of the u axis, that is  $-1 < u < 1$ ,  $u < -1$  and  $u > 1$ , okay. Actually what we are doing is, we are  $\phi_1$ , when you are looking at the conditions here,  $\phi_1 = \text{argument of } w+1$ , okay. We are looking at these cases. What happens when we consider the part of this, when  $u < -1$ .  $u < -1$  means,  $v=0$ , so this is argument of  $u+1$ , okay, as  $v=0$ . And  $\phi_2$  similarly, is argument of  $u-1$ , okay, as  $v=0$ .

So along the real axis in the w plane, when  $u < -1$ , then  $u+1 < 0$ .  $u+1 < 0$  means argument of  $u+1$  is  $\pi$ , okay. So  $\phi_1$  is  $\pi$ . And when  $u < -1$ , then  $u-1$  is less than  $-2$ . So  $\phi_2$  is also  $\pi$ , okay. And so when  $u < -1$ ,  $\phi_2 - \phi_1 = 0$ , okay. And when  $-1 < u < 1$ , then  $u+1 > 0$ . So  $\phi_1 = 0$ , okay. While  $u-1 < 0$ , so  $\phi_2 = \pi$ . So  $\phi_2 - \phi_1 = \pi$ , okay. And when  $u > 1$ , then  $u+1 > 0$  and  $u-1$  is also greater than 0. So argument of  $u+1$  and argument of  $u-1$ , both are equal to 0.

So then  $\phi_2 - \phi_1 = 0 - 0 = 0$ , okay. So this is how we look at this. So over  $-1$  to  $1$ ,  $\phi_2 - \phi_1$  is  $\pi$ . So that is  $Tuv$  becomes  $T_0$ . So this is  $T_0$  and on other parts of u axis,  $\phi_2 - \phi_1$  becomes 0. So  $Tuv = 0$ , okay. So  $Tuv$  function is harmonic in the half plane  $v > 0$  and satisfies these boundary conditions. You can see here  $T=0$ , here  $T=0$ , here  $T=T_0$ , okay. And this  $T=0$  corresponds to  $u < -1$ . It corresponds to, it is equal to  $T_0$  for the segment along the u axis,  $-1$  to  $1$  and it is 0 when  $u > 1$ . So this figure explains this.

(Refer Slide Time: 35:49)

Since  $\tan \phi_1 = \frac{v}{u+1}$

and  $\tan \phi_2 = \frac{v}{u-1}$

We have  $T(u, v) = \frac{T_0}{\pi} \tan^{-1} \frac{2v}{u^2 + v^2 - 1}$

Handwritten derivation for  $\phi_2 - \phi_1$ :

$$\begin{aligned} \tan(\phi_2 - \phi_1) &= \frac{\tan \phi_2 - \tan \phi_1}{1 + \tan \phi_2 \tan \phi_1} \\ &= \frac{\frac{v}{u-1} - \frac{v}{u+1}}{1 + \frac{v}{u-1} \cdot \frac{v}{u+1}} \\ &= \frac{\frac{v(u+1) - v(u-1)}{(u-1)(u+1)}}{\frac{(u-1)(u+1) + v^2}{(u-1)(u+1)}} \\ &= \frac{2v}{u^2 + v^2 - 1} \end{aligned}$$

$\phi_2 - \phi_1 = \tan^{-1} \frac{2v}{u^2 + v^2 - 1}$

Now  $\tan \phi_1 = v/u+1$ ,  $\tan \phi_2 = v/u-1$ ,  $Tuv = t_0/\pi$ , we can write this. You see,  $T_0/\pi$   $\phi_2 - \phi_1$  is

that, this is the expression. So we can write  $\tan \phi_2 - \phi_1 = \frac{\tan \phi_2 - \tan \phi_1}{1 + \tan \phi_2 \tan \phi_1}$ , okay. So here you put the value of  $\tan \phi_2$  is  $v/u-1$  and this is  $v/u+1$  and then we have  $1+v^2/u^2-1$ . So this is  $uv+v-uv+v/u^2-1/u^2+v^2-1/u^2-1$ . So what you get is  $2v/u^2+v^2-1$ . So  $\phi_2-\phi_1 = \tan^{-1} \frac{2v/u^2+v^2-1}{u^2+v^2-1}$ . So we get this expression, okay.

(Refer Slide Time: 37:22)

We have

$$w = \cosh z = \cosh x \cos y + i \sinh x \sin y$$

Hence

$$u = \cosh x \cos y, \quad v = \sinh x \sin y$$

Then

$$T(u(x,y), v(x,y)) = \frac{T_0}{\pi} \tan^{-1} \frac{2 \sinh x \sin y}{\sinh^2 x - \sin^2 y}$$

Handwritten red notes:

$$u^2 + v^2 = \cosh^2 x \cos^2 y + \sinh^2 x \sin^2 y = 1$$

$$= (1 + \sinh^2 x)(1 - \sin^2 y) + \sinh^2 x \sin^2 y = 1$$

$$= 1 + \sinh^2 x - \sinh^2 x \sin^2 y + \sinh^2 x \sin^2 y = 1$$

Slide footer: FT BOARDS, NPTEL ONLINE CERTIFICATION COURSE, 19

Now we have  $2 = \cos \text{ hyperbolic } z$  which is  $\cos \text{ hyperbolic } x \cdot \cos y + i \sin \text{ hyperbolic } x \cdot \sin y$ . So  $u = \cos \text{ hyperbolic } x \cos y$ ,  $v = \sin \text{ hyperbolic } x \sin y$ . So let us put these values of  $u$  and  $v$  here.  $v = \sin \text{ hyperbolic } x \sin y$ . So we put that value and here we see that  $u^2 + v^2 - 1 = \cos^2 \text{ hyperbolic } x \cos^2 y + \sin^2 \text{ hyperbolic } x \sin^2 y - 1$ . This gives you, we have to convert it to  $\sin \text{ hyperbolic}$  and  $\sin y$ .

So let us use the relations  $\cos^2 \text{ hyperbolic } x - \sin^2 \text{ hyperbolic } x = 1$ , okay. So we have this  $1 + \sin^2 \text{ hyperbolic } x$  and  $\cos^2 y$  is  $1 - \sin^2 y$ . So we get this  $1 + \sin^2 \text{ hyperbolic } x - \sin^2 y - \sin^2 \text{ hyperbolic } x \sin^2 y + \sin^2 \text{ hyperbolic } x \sin^2 y - 1$ . So this cancels with this and this expression cancels with this and we get  $\sin^2 \text{ hyperbolic } x - \sin^2 \text{ hyperbolic } x \sin^2 y$ . So we have put it here. So this is  $Tuv$  in terms of  $xy$ ,  $Tuxyvyx$ .

(Refer Slide Time: 39:16)

Let us denote  $T(u(x, y), v(x, y))$  by  $T^*(x, y)$  then

$$T^*(x, y) = \frac{T_0}{\pi} \tan^{-1} \frac{2 \sinh x \sin y}{\sinh^2 x - \sin^2 y}$$

Now, consider the function

$$(\sinh x + i \sin y)^2 = \sinh^2 x - \sin^2 y + 2i \sinh x \sin y$$

Then

$$T^*(x, y) = \frac{2T_0}{\pi} \arg(\sinh x + i \sin y)$$

Thus, the solution of our problem is

$$T^*(x, y) = \frac{2T_0}{\pi} \tan^{-1} \frac{\sin y}{\sinh x}$$

*Handwritten notes in red:*  
 $\arg z^2 = 2 \arg z$   
 $T^*(x, y) = \frac{T_0}{\pi} \arg(\sinh x + i \sin y)^2$   
 $= \frac{2T_0}{\pi} \arg(\sinh x + i \sin y)$

ET ROOREZEE    NPTEL ONLINE CERTIFICATION COURSE    20

Let us now define  $T(u(x, y), v(x, y))$  by  $T^*(x, y)$ . Let us denote it by that. Then  $T^*(x, y)$  is  $T_0/\pi \tan^{-1} 2 \sinh x \sin y / (\sinh^2 x - \sin^2 y)$ , okay. Now if you consider this function,  $(\sinh x + i \sin y)^2$ , you square this, you get  $\sinh^2 x - \sin^2 y + 2i \sinh x \sin y$ . And imaginary part here is  $2 \sinh x \sin y$  which is here and real part is this one, okay which is here, okay.

So this means that  $\tan^{-1}$  of imaginary part/the real part is nothing but argument of  $\sinh x + i \sin y$  whole square, okay. So we can write  $T^*(x, y) = T_0/\pi \arg(\sinh x + i \sin y)^2$ , okay. And we know that argument of a complex number  $z$  square, argument of  $z^2$  is  $2 \times \arg(z)$ . So this is equal to  $2T_0/\pi \arg(\sinh x + i \sin y)$ , okay.

So this is what we get. And then argument of  $\sinh x + i \sin y$ , we can write as  $\tan^{-1} \sin y / \sinh x$ . So we get  $T^*(x, y) = 2T_0/\pi \tan^{-1} \sin y / \sinh x$ . Now this is the solution to our problem. You can see that this  $T^*$  also satisfies the boundary conditions. You see the boundary conditions are here  $y=0$ , okay. Here  $y=\pi$ . So when  $y=0$  and  $y=\pi$ , we have temperature 0, okay.

And here temperature is  $T_0$ . So let us see, let us show that these conditions are satisfied here. So when  $y$  is 0,  $\sin y$  is 0, so this  $T^*(x, y)$  is 0. When  $y$  is  $\pi$ , then again  $\sin y=0$ , so this  $T^*=0$ . And

when  $x=0$  because along the left part of the boundary, along this part,  $x=0$ . So  $x=0$  means  $\sin^{-1} \infty$  which is  $\pi/2$ . So  $2T_0/\pi$  and  $2\pi/2$  will give you  $T_0$ .

So  $T^*(x,y)$  satisfies the given boundary conditions and it is a harmonic function. So this is how we have to solve this Dirichlet problem. We use the function  $w = \cosh z$  to map the semi-infinite strip on to the upper half of the  $w$  plane. We solve it there, okay and then we use the inverse transformation to bring it, to get back the solution of the original problem.

**(Refer Slide Time: 42:26)**

Now, this function is harmonic in the interior of our strip because the harmonic function  $T(u, v)$  remains harmonic under a change of variables arising from a one to one conformal mapping giving by the analytic function

$$w = \cosh z.$$

Furthermore,  $T^*(x, y)$  satisfies the boundary conditions; we see that

$$T^* = 0 \text{ when } y = 0 \text{ or } y = \pi$$

and

$$T^* = T_0 \text{ when } x = 0$$

The isotherms (curves of constant temperature) are the curves

$$\frac{\sin y}{\sinh x} = \text{constant}.$$

ET ROOFTOP   NPTEL ONLINE CERTIFICATION COURSE   21

Now this function  $T^* = 2T_0/\pi \tan^{-1} \sin y / \sinh x$  is a harmonic function in the interior of our strip because the harmonic function  $T(u, v)$  remains harmonic under a change of variables as we have proved earlier arising from a one to one conformal mapping given by  $w = \cosh z$ . And  $T^*(x,y)$  satisfies the boundary conditions  $T^*=0$  when  $y=0$  or  $y=\pi$ ,  $T^*=T_0$  when  $x=0$ .

So this is the solution to our problem. Now the curves of constant temperatures are the curves given by  $\sin y / \sinh x = \text{constant}$ . Because when  $T^*(x,y) = \text{constant}$ , then  $\sin y / \sinh x = \text{constant}$ . So these are the isotherms. The isotherms are the curves given by  $\sin y / \sinh x = \text{constant}$ . So with that I come to the end of this lecture. Thank you very much for your attention.
