**Lecture – 37**  
**Finite Fourier Transforms**

Hello friends, welcome to my lecture on finite Fourier transforms, we have seen that the Fourier transform technique can be applied to those problems which involved in finite or semi-infinite domains like you have a wire of infinite length or you have a semi-infinite strip, okay so there we can apply Fourier transform techniques to solve the differential equation; partial differential equation.

Now but in many practical problems, we often come across finite intervals in boundary value problems therefore, we need to extend the Fourier transform method to problems where the range of independent variable is finite, there in versus can then we found by applying the theory of Fourier series.

**(Refer Slide Time: 01:15)**

**Finite Fourier transform**

The Fourier transform technique discussed so far can be applied to the problems involving infinite or semi-infinite domains. But in practical situations, we often come across finite intervals in boundary value problems. Therefore we need to extend the Fourier transform method to problems where the range of the independent variable is finite. Their inverses can then be found by applying the theory of Fourier series. We know that if a function satisfies the Dirichlet conditions in the interval  $0 \leq x \leq l$ , then its Fourier sine series is given by

$$f(x) = \sum_{n=1}^{\infty} b_n \sin\left(\frac{n\pi x}{l}\right). \quad (1)$$

where

$$b_n = \frac{2}{l} \int_0^l f(x) \sin\left(\frac{n\pi x}{l}\right) dx, \quad n = 1, 2, \dots$$

We know that if a function satisfies the Dirichlet conditions in the interval  $0 \leq x \leq l$  then its Fourier sine series is given by  $F(x) = \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{l}$ , let us recall the half range expansions, okay, when the function is defined over the half range,  $0 \leq x \leq l$ , then we

can extend this function over the other half that is  $-l < x < 0$  by considering  $f$  to be an even or as in odd function.

If you consider  $f$  to be an odd function, then you will get the Fourier sine series, okay which is known as half range Fourier series, okay half range Fourier sine series, so there you get  $f(x) = \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{l}$  and the value of the Fourier coefficients  $b_n$  is  $\frac{2}{l} \int_0^l f(x) \sin \frac{n\pi x}{l} dx$ , where  $n$  takes value 1, 2, 3 and so on. If you consider the even extension over the other half, okay over the interval  $-l$  to  $l$ , you take the function  $f$  to be an even function.

**(Refer Slide Time: 02:32)**

#### Finite Fourier transform cont...

The Fourier series in (1) converges to  $f(x)$  at each point of continuity of  $f$  and to the average of left hand and right limits i.e.  $\frac{1}{2}\{f(x_0+) + f(x_0-)\}$  at each point  $x = x_0$  of discontinuity of  $f$ .

Similarly  $f(x)$  has Fourier cosine series

$$f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos \left( \frac{n\pi x}{l} \right),$$

where

$$a_n = \frac{2}{l} \int_0^l f(x) \cos \left( \frac{n\pi x}{l} \right) dx, \quad n = 0, 1, 2, \dots$$

Then you get the Fourier sine series, okay and the Fourier sine series is given by  $f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos \frac{n\pi x}{l}$ , where the Fourier coefficients  $a_n$ 's are given by  $\frac{2}{l} \int_0^l f(x) \cos \frac{n\pi x}{l} dx$  and takes values 0, 1, 2, 3 and so on. When you take  $n = 0$ , you get the value of this  $a_0$  and for  $n = 1$  to 3, you get the values of these coefficients  $a_n$ 's and you also know that the Fourier series; half range Fourier series convergence to  $f(x)$ , okay, whether it is Fourier sine series or Fourier cosine series, okay, it converges to  $f(x)$  at each point of continuity of  $f$ .

And to the average of left hand and right hand limits at each point of discontinuity of  $f$ , say the point of discontinuity is  $x_0$ , then you have the sum of the series; Fourier series as half of  $f(x_0^+) + f(x_0^-)$ , okay, so we have to; we need this definitions here.

(Refer Slide Time: 03:39)

**Finite Fourier sine and cosine transform**

If  $f(x)$  satisfies Dirichlet conditions in the interval  $0 \leq x \leq l$ , then finite sine transform is defined as

$$S_n = S[f] = \frac{2}{l} \int_0^l f(x) \sin\left(\frac{n\pi x}{l}\right) dx, \quad n = 1, 2, \dots$$

with its inverse sine transform given by

$$S^{-1}(S_n) = f(x) = \sum_{n=1}^{\infty} S_n \sin\left(\frac{n\pi x}{l}\right).$$

This transform should be used with Dirichlet boundary conditions, that specify the value of temperature  $u$  at  $x = 0$  and  $x = l$ .

*Handwritten notes:*  
 $S_n = S[f]$   
 $\Leftrightarrow S^{-1}(S_n) = f(x)$

Now, let us consider finite Fourier sine and cosine transform, if  $f(x)$  satisfies Dirichlet conditions in the interval  $0 \leq x \leq l$ , then finite sine transform, okay, the finite sine transform is defined as  $S_n = S[f] = \frac{2}{l} \int_0^l f(x) \sin \frac{n\pi x}{l} dx$ , okay, the value of this okay,  $\frac{2}{l} \int_0^l f(x) \sin \frac{n\pi x}{l} dx$ , it is defined as finite sine transform, okay, we denote by  $S_f$  or you can also write  $S_n$ , okay.

And its inverse sine transform is given by  $S^{-1}$  of  $S_n$ ;  $S^{-1}$  of  $S_n = S_n$  is  $S_f$ , okay, so  $S^{-1}$  of  $S_n = f(x)$ , okay, so  $S^{-1}$  of  $S_n = f(x) = \sum_{n=1}^{\infty} S_n \sin \frac{n\pi x}{l}$ , so this we denote by  $S_n$ , okay, then  $f(x)$  is given by  $\sum_{n=1}^{\infty} S_n \sin \frac{n\pi x}{l}$ , okay. So, in the finite sine transform, okay the Fourier coefficient  $b_n$  is replaced by  $S_n$  actually.

$S_n$  is the Fourier sine transform of  $f(x)$ , okay and then the Fourier series; Fourier sine series, okay, half range Fourier series; Fourier sine series gives the value of the function  $f(x)$  because now, we know the values of  $S_n$ 's okay. So, this transform is applied when you are given the Dirichlet

boundary conditions, remember this transform will be applied only when we are given Dirichlet boundary conditions.

Because they satisfy; they specify the value of temperature  $u$  at  $x = 0$  and  $x = l$ , this will be clear why we apply the Dirichlet boundary; why we apply Fourier sine transform in the case of Dirichlet boundary conditions, this will be clear, later when we consider the partial differential equations, there when we try to solve the partial differential equation will lead to take the transform of  $u_{xx}$ .

And when you take the transform of  $u_{xx}$ , there if you have Dirichlet boundary conditions, you will apply sin transform, if you have Dirichlet boundary condition, you will apply Fourier sine transform, okay finite cosine transform, so this is to be applied when we are given Dirichlet boundary conditions, Fourier sine transform we will apply then.

**(Refer Slide Time: 06:25)**

Finite Fourier sine and cosine transform cont...

The finite cosine transform is defined as

$$C_n = C[f] = \frac{2}{l} \int_0^l f(x) \cos\left(\frac{n\pi x}{l}\right) dx, \quad n = 0, 1, 2, \dots$$

with its inverse cosine transform given by

$$C^{-1}(C_n) = f(x) = \frac{C_0}{2} + \sum_{n=1}^{\infty} C_n \cos\left(\frac{n\pi x}{l}\right).$$

This transform should be used with Neumann boundary conditions, that specify the value of  $\frac{\partial u}{\partial x}$  at  $x = 0$  and  $x = l$ .  
Both of these transforms reduce a PDE to an ODE.

Now, finite cosine transform is defined as  $C_n = \frac{2}{l} \int_0^l f(x) \cos \frac{n\pi x}{l} dx$ , okay, so we have the value of  $n$  here, this  $n$  value is replaced by  $C_n$ , you can say  $C_f$ , okay the this  $C_f$  gives the finite cosine transform of  $f$  and  $f(x)$  is then determined from this series, okay, we have the values of  $C_n$ 's now, this is  $C_0$ ,  $n$  is nothing but  $C_n$ , so this  $C_0/2$  and then we have  $\sum_{n=1}^{\infty} C_n \cos \frac{n\pi x}{l}$ .

So, putting the values of  $C_0$  and  $C_n$  here, we get the value of  $f(x)$ , okay, so Fourier cosine transform is to be used when we are given the Neumann boundary conditions, okay. In the Neumann boundary conditions, we have the value of the temperature gradient  $u_x$  at  $x = 0$  and  $x = 1$ . Now, both of these transforms when we were apply to partial differential equations, they will reduce them to ordinary differential equations.

(Refer Slide Time: 07:41)

**Example**

Let  $f(x) = 1, x \in (0, 1)$  then

$$S_n = 2 \int_0^1 \sin(n\pi x) dx = \begin{cases} \frac{4}{n\pi}, & n \text{ is odd,} \\ 0, & n \text{ is even.} \end{cases}$$

Applying the inverse sine transform

$$f(x) = \sum_{n=1}^{\infty} S_n \sin\left(\frac{n\pi x}{L}\right)$$

$$1 = \sum_{n=1}^{\infty} \frac{4}{n\pi} \sin(n\pi x)$$

$$1 = \sum_{m=1}^{\infty} \frac{4}{(2m-1)\pi} \sin((2m-1)\pi x)$$

$$1 = \frac{4}{\pi} \sum_{n=1}^{\infty} \frac{1}{2n-1} \sin((2n-1)\pi x)$$

Handwritten notes:

- $f(x) = \sum_{n=1}^{\infty} S_n \sin\left(\frac{n\pi x}{L}\right)$
- $L=1$
- $1 = \sum_{n=1}^{\infty} S_n \sin(n\pi x)$
- $S_n = 2 \left( -\frac{\cos n\pi x}{n\pi} \right)$
- $= \frac{2}{n\pi} (1 - \cos n\pi)$
- $= \frac{2}{n\pi} (1 - (-1)^n)$
- $n = 2m-1$

And now, let us see how we solve differential; partial differential equations using these finite sine and cosine transforms, so let us consider first example, suppose we are given  $f(x) = 1$  over the open interval  $0, 1$ , okay then the finite sine transform of  $f$ , okay, finite sine transform of  $f$   $S_n$  is given by this expression, okay, since the domain of definition of  $f$  there is  $0$  to  $1$ ,  $L$  will be  $= 1$ , so we have  $2$  over  $1$ ,  $0$  to  $1$   $f(x) \sin$  and  $\pi x$  over  $1$   $dx$ , okay.

So, we have this,  $2$  over  $1$   $0$  to  $1$   $f(x)$ , in place of  $f(x)$ , we put  $1$ , so  $1 * \sin n\pi x$  over;  $\sin n\pi x$   $dx$ , so  $S_n$  will be  $= 2$  times, let us integrate, you get  $-\cos n\pi x$  divided by  $n\pi$ , you put the values, you get  $2$  over  $n\pi$   $1 - \cos n\pi$ , okay. Now,  $\cos n\pi$  is  $-1$  to the power  $n$ , so you get  $2$  over  $n\pi$   $1 - (-1)^n$  to be power  $n$ , okay. Now, when  $n$  is even, you get this value  $0$ , okay, so when  $n$  is even integer, the value is  $0$ .

When  $n$  is an odd integer, we will have  $4$  over  $n\pi$ , okay, so  $4$  over  $n\pi$ , when  $n$  is an odd integer, so  $S_n = 4$  over  $n\pi$ , when  $n$  is an odd integer and  $0$  when  $n$  is an even integer, now let us apply

the inverse sine transform okay, so inverse sin transform is obtained from  $f(x) = \sum_{n=1}^{\infty} \frac{4}{n\pi} \sin n\pi x$ , so we can get the; here now,  $f(x)$  is given to be  $= 1$ , so  $1 = 4$  over  $\pi$ , okay  $4$  over  $\pi$ , okay this is  $f(x) = \sum_{n=1}^{\infty} \frac{4}{n\pi} \sin n\pi x$ , okay.

So,  $1$  is  $= 1$  here, okay, so we get  $\sum$  and  $f(x) = 1$ ,  $f(x)$  is continuous over the whole interval  $0, 1$ , okay, so  $1 =$ ; let us put  $f(x) = 1$ ,  $\sum_{n=1}^{\infty} \frac{4}{n\pi} \sin n\pi x$ . now,  $\frac{4}{n\pi}$  is  $0$ , when  $n$  is even, okay,  $\frac{4}{n\pi}$  is  $4$  over  $n\pi$ , when  $n$  is odd, so we can say  $1 = \sum_{n \text{ is odd integer}} \frac{4}{n\pi} \sin n\pi x$ , okay upto infinity,  $n = 1$  to infinity but  $n$  is odd, okay, subject to the condition that  $n$  is odd and  $\frac{4}{n\pi}$  is  $4$  over  $n\pi$ .

Now, if you take  $n = 2m - 1$  okay then when  $m$  is takes value  $1, 2, 3$  and so on,  $n$  will take odd integral values, so we will have  $n = 1$  to infinity, we can write  $4$  over  $2m - 1\pi$  and then  $\sin 2m - 1\pi x$ , okay, so replace now  $m$  by  $n$ , so you get  $1 = 4$  over  $\pi$  we can write outside the summation, so  $1 = 4$  over  $\pi$ ,  $\sum_{n=1}^{\infty} \frac{1}{2n - 1} \sin 2n - 1\pi x$ , so this is how we find the inverse sine transform, when  $\frac{4}{n\pi}$  is known, okay.

(Refer Slide Time: 11:17)

**Properties of the transforms**

To apply these finite Fourier transforms, we must know how to transform the appropriate derivatives. We have the following formulas;

$\frac{\partial u}{\partial t} = \frac{d}{dt} u$

$S\left(\frac{\partial u}{\partial t}\right) = \frac{d}{dt} S[u]$

$C_n = C[f]$

$\frac{\partial u}{\partial x} = \frac{d}{dx} u$

$C\left(\frac{\partial u}{\partial x}\right) = \frac{d}{dx} C[u]$

$S[u_t] = \frac{dS[u]}{dt}, S[u_{tt}] = \frac{d^2 S[u]}{dt^2}$

$C[u_t] = \frac{dC[u]}{dt}, C[u_{tt}] = \frac{d^2 C[u]}{dt^2}$

$S[u_{xx}] = \frac{2}{l} \int_0^l \frac{\partial^2 u}{\partial x^2} \sin\left(\frac{n\pi x}{l}\right) dx$

$C[u_x] = \frac{2}{l} \left[ \left( \frac{\partial u}{\partial x} \sin \frac{n\pi x}{l} \right)_0^l - \int_0^l \frac{\partial u}{\partial x} \left( \frac{n\pi}{l} \cos \frac{n\pi x}{l} \right) dx \right]$

Handwritten notes on the right side of the slide:

- $S_n = S[f]$
- $= \frac{2}{l} \int_0^l f(x) \sin \frac{n\pi x}{l} dx$
- $S[u(x,t)] = \frac{2}{l} \int_0^l u(x,t) \sin \frac{n\pi x}{l} dx$
- $S[u_t] = \frac{2}{l} \int_0^l \frac{\partial u}{\partial t} \sin \frac{n\pi x}{l} dx$
- $= \frac{2}{l} \frac{d}{dt} \left[ \int_0^l u(x,t) \sin \frac{n\pi x}{l} dx \right]$
- $= \frac{d}{dt} \left[ \frac{2}{l} \int_0^l u(x,t) \sin \frac{n\pi x}{l} dx \right]$

Now, let us see; we can solve the partial differential equations, when you solve the partial differential equations, we will need, suppose  $t$  the time variable, okay,  $x$  is the space variable, so we will need to find the sine transform of; sine or cosine transform of  $u_t$ ,  $u_{tt}$ , okay,  $u_x$ ,  $u_{xx}$  and

so on. So, sine transform of  $u_t$ , okay, sine transform of  $u_t$  let us recall that sine transform of  $S_n = S$  of  $f$  we have written.

$S$  of  $f =$ ; you take  $2$  over  $l$ ,  $0$  to  $l$   $\int f(x) \sin \frac{n\pi x}{l} dx$ , this is how we have defined, okay, so here we need the sine transform of  $u_t$ ;  $u$  is a function of  $x$  and  $t$ , okay,  $u$  is a function of  $x$  and  $t$ , so  $S$  of; in place of  $f$ , we shall write  $u_t$ , okay, this will be  $2$  over  $l$   $0$  to  $l$ , in place of  $f(x)$ , we shall write  $u_t \sin \frac{n\pi x}{l} dx$ , okay. Now, if you want the sine transform of  $u_t$ ;  $u_t$  is partial derivative of  $u$  with respect to  $t$ , okay.

So, this will be  $S$  of  $u_t$ , okay,  $u_t = \frac{d}{dt} u$ , in place of  $u_t$ , now we will have  $u$ , so partial derivative of  $u$  with respect to  $t \cdot \sin \frac{n\pi x}{l} dx$  since  $t$  and  $x$  are independent of each other, we can write it is  $2$  over  $l$   $\frac{d}{dt}$  of  $0$  to  $l$   $\int u \sin \frac{n\pi x}{l} dx$ , okay and this  $2$  over  $l$  we can take inside, so we have  $\frac{d}{dt}$  of  $2$  over  $l$   $0$  to  $l$   $\int u \sin \frac{n\pi x}{l} dx$ , meaning that  $S u_t = \frac{d}{dt}$  of  $S u$  okay, this is  $\frac{d}{dt}$  of  $S u$ , okay.

Similarly, if you have  $S u_{tt}$ , okay, in place of  $u_t$ , you have  $u_{tt}$  here, then you will have  $u_{tt}$  here, you can write  $\frac{d^2}{dt^2}$  outside, then  $S u_{tt}$  will be  $= \frac{d^2}{dt^2}$  of  $S u$  in a similar manner, okay,  $C u_t$ ; how we define  $C_f$ ?  $C_n =$ ;  $C_f$  we defined as  $2$  over  $l$   $0$  to  $l$   $\int f(x) \cos \frac{n\pi x}{l} dx$ , okay. So,  $C u_t$ , we can similarly write,  $C u_t$  will be  $= 2$  over  $l$   $0$  to  $l$   $\int u_t \cos \frac{n\pi x}{l} dx$  and this will be  $= \frac{d}{dt}$  of  $C u$  as we have seen here, okay.

So, we get the same thing and then here we also similarly get  $C u_{tt} = \frac{d^2}{dt^2}$  of  $C u$ , okay, now let us find  $C_s$  of  $U_{xx}$ , okay,  $S$  of  $U_{xx}$  means  $2$  over  $l$   $0$  to  $l$  second order partial derivative of  $U$  with respect to  $x$ , okay, as I said  $U$  is a function of  $x$  and  $t$ , so partial derivative; second order partial derivative  $U$  with respect to  $x \cdot \sin \frac{n\pi x}{l} dx$ . Now what we do; we integrate it by part, okay.

So, integration of by parts gives you  $2$  over  $l$ , integral of second derivative of  $U$  with respect to  $x$ , when you do, you get first order partial derivative of  $U$  with respect to  $x$ , so  $U_x \cdot \sin \frac{n\pi x}{l}$ ,  $0$  to  $l$ , okay,  $-0$  to  $l$   $U_x$ , okay, then derivative of  $\sin \frac{n\pi x}{l}$ , so that is  $\frac{n\pi}{l} \cos \frac{n\pi x}{l}$

$x$  over  $l$   $dx$ . Now, you can see here when you put  $x$  as  $l$ ,  $\sin n\pi$  is  $0$ , when you put  $x$  as  $0$ ,  $\sin n\pi$  is again  $0$ , okay and  $u_x$  is finite quantity, so this is  $0$ , okay, this part becomes  $0$ .

**(Refer Slide Time: 16:19)**

Properties of the transforms cont...

$$\begin{aligned}
 &= -\frac{2n\pi}{l^2} \int_0^l \frac{\partial u}{\partial x} \cos \frac{n\pi x}{l} dx \\
 &= -\frac{2n\pi}{l^2} \left[ \left( u(x,t) \cos \frac{n\pi x}{l} \right) \Big|_0^l - \int_0^l u(x,t) \left( -\frac{n\pi}{l} \sin \frac{n\pi x}{l} \right) dx \right] \\
 &= -\frac{2n\pi}{l^2} \left[ u(l,t) \cos n\pi - u(0,t) + \frac{n\pi}{l} \int_0^l u(x,t) \sin \frac{n\pi x}{l} dx \right] \\
 &= \frac{2n\pi}{l^2} \left[ u(0,t) + (-1)^{n+1} u(l,t) \right] - \left( \frac{n\pi}{l} \right)^2 S[u]
 \end{aligned}$$

Handwritten notes in red ink on the slide include:  
 $= -\left(\frac{n\pi}{l}\right)^2 \int_0^l u(x,t) \sin \frac{n\pi x}{l} dx$   
 $= -\left(\frac{n\pi}{l}\right)^2 S[u]$   
 $-\frac{2n\pi}{l^2} \cdot \frac{n\pi}{l} \int_0^l u(x,t) \sin \frac{n\pi x}{l} dx$

And therefore, we have  $-2$  over  $l$ , so  $-2n\pi$  over  $l$  square  $0$  to  $l$   $U_x \cos n\pi$  over  $l$   $dx$ , okay, so we get this,  $-2n\pi$  over  $l$  square  $0$  to  $l$ ,  $u_x \cos n\pi$  over  $l$   $dx$ , again we integrate by parts, okay, so integration of  $U_x$  gives you  $U_{xt}$ , okay,  $U_{xt} \cos n\pi$  over  $l$   $0$  to  $l$ ,  $-0$  to  $l$   $U_{xt}$ , then derivative of  $\cos n\pi$  over  $l$ , so  $-n\pi$  over  $l$   $\sin n\pi$  over  $l$   $dx$ , okay. Now, put  $x$  as  $l$ , okay, so  $U_{lt} \cos n\pi - U_{0t} \cos 0$ ;  $\cos 0$  is  $1$ , okay.

Then, here we have minus, minus; plus okay, so  $+n\pi$  over  $l$   $0$  to  $l$   $U_{xt} \sin n\pi$  over  $l$   $dx$ , okay, now let us recall that  $\cos n\pi$  is  $-1$  to the power  $n$ ;  $-1$  to the power  $n$  is the value of  $\cos n\pi$ , so you multiply by this  $-1$  inside, so  $2n\pi/l$  square, you get when you multiply by  $-1$ , you get  $U_{0t}$  here, then  $-1$  to the power  $n*-1$ ,  $-1$  to the power  $n+1$  \*  $U_{lt}$ , okay, so this we multiply to this and then this  $-2n\pi$  over  $l$  square, when you multiply here, what you get?

You get  $-2n\pi$  over  $l$  square, we multiply to this, so  $n\pi$  over  $l$   $0$  to  $l$   $U_{xt} \sin n\pi$  over  $l$   $dx$ , okay, if you can write; this you can write as  $-n\pi$  over  $l$  whole square  $2$  over  $l$   $0$  to  $l$   $U_{xt} \sin n\pi$  over  $l$   $dx$ , okay, so this is nothing but finite sine transform of  $U$ , okay, so we can write it as  $-n\pi$  over  $l$  whole square \*  $S_u$ , so you can see, this is  $-n\pi$  over  $l$  whole square  $S_u$ . Now, you can

see when you finite sine transform of  $U_{xx}$ , when you find, it comes out to be in this form, okay this form, this one, okay.

So, here you need to know the value of  $U_0$  and  $U_l$ , the value of temperature at  $x = 0$  and  $x = l$  at the 2 boundary points of the problem, so we are given Dirichlet boundary conditions therefore, whenever Dirichlet boundary conditions are given, we use the finite sine transform to solve that problem, okay. Now, let us find the Fourier; finite sine transform of  $U_{xx}$ , okay.

**(Refer Slide Time: 19:25)**

Properties of the transforms cont...

Similarly,

$$C_{[u_{xx}]} = \frac{2}{l} \int_0^l \frac{\partial^2 u}{\partial x^2} \cos\left(\frac{n\pi x}{l}\right) dx$$

$$= \frac{2}{l} \left[ \left( \frac{\partial u}{\partial x} \cos\frac{n\pi x}{l} \right)_0^l - \int_0^l \frac{\partial u}{\partial x} \left( -\frac{n\pi}{l} \sin\frac{n\pi x}{l} \right) dx \right]$$

$$= \frac{2}{l} \left[ \left( \frac{\partial u}{\partial x} \right)_{x=l} \cos n\pi - \left( \frac{\partial u}{\partial x} \right)_{x=0} + \frac{n\pi}{l} \int_0^l \frac{\partial u}{\partial x} \sin\frac{n\pi x}{l} dx \right]$$

Now,

$$\int_0^l \frac{\partial u}{\partial x} \sin\frac{n\pi x}{l} dx = \left[ \left( u(x, t) \sin\frac{n\pi x}{l} \right)_0^l - \int_0^l u(x, t) \left( \frac{n\pi}{l} \cos\frac{n\pi x}{l} \right) dx \right]$$

Handwritten notes on the slide:

- $C_n = C\left[\frac{f}{l}\right] = \frac{2}{l} \int_0^l f(x) \cos\frac{n\pi x}{l} dx$
- $u_{xx} = \frac{\partial^2 u}{\partial x^2}$
- $\int_0^l u(x, t) \cos\frac{n\pi x}{l} dx = \frac{l}{2} C[u]$
- $\frac{2}{l} \left[ (u_x)_{x=l} (-1)^n - (u_x)_{x=0} + \frac{n\pi}{l} \left( -\frac{l}{2} \right) \int_0^l u(x, t) \cos\frac{n\pi x}{l} dx \right]$

So, finite cosine transform of  $U_{xx}$ , if you want to find then you, we know that cosine transform is given by  $C_n = C_f = \frac{2}{l} \int_0^l f(x) \cos\frac{n\pi x}{l} dx$ , okay, this is finite cosine transform of  $a$ ; so cosine transform of  $U_{xx}$ , so in place of  $x$ , we are now having  $U_{xx}$ , okay, so  $\frac{2}{l} \int_0^l U_{xx} \cos\frac{n\pi x}{l} dx$  integration by parts gives us  $\frac{2}{l} U_x \cos\frac{n\pi x}{l}$  from  $0$  to  $l$ ,  $-\frac{2}{l} \int_0^l U_x \frac{d}{dx} \cos\frac{n\pi x}{l} dx$  will give  $-\frac{2}{l} \int_0^l U_x \sin\frac{n\pi x}{l} dx$ .

Then let us put the limits, so  $\frac{2}{l} U_x$  at  $x = l * \cos n\pi - U_x$  at  $x = 0$ ,  $\cos 0$  is  $1$  and then this is  $+\frac{2}{l} \int_0^l U_x \sin\frac{n\pi x}{l} dx$ . Now, this integral, okay  $\int_0^l U_x \sin\frac{n\pi x}{l} dx$ , let us differentiate by parts separately okay, so  $\int_0^l U_x \sin\frac{n\pi x}{l} dx$ , when we integrate by parts we get  $U_x t \sin\frac{n\pi x}{l}$  from  $0$  to  $l$ ,  $-\int_0^l U_{xt} \frac{d}{dx} \sin\frac{n\pi x}{l} dx$ , derivative of  $\sin\frac{n\pi x}{l}$  gives  $\frac{n\pi}{l} \cos\frac{n\pi x}{l} dx$ , okay.

Now, you put  $x$  as  $l$  here,  $U$  is finite, so  $\sin n\pi = 0$ , gives 0 value and when you put  $x = 0$ , again  $\sin 0$  is 0 and  $U_{xt}$  is finite, so we get 0, so this part becomes 0 and what we get here; we get  $-\frac{n\pi}{l} \int_0^l U_x t \cos \frac{n\pi x}{l} dx$  which can be related to the finite cosine transform of  $U$ , okay, so what you get here; this is  $\frac{2}{l} U_x$  at  $x = l \cos \frac{n\pi x}{l}$  is  $-1$  to the power  $n$  -  $U_x$  at  $x = 0$  and  $\frac{n\pi}{l}$  here we have and from here, what we get;  $-\frac{n\pi}{l}$  over  $l$ , okay.

And  $0$  to  $l$   $U_{xt}$ , okay  $\cos \frac{n\pi x}{l} dx$ , okay, so and we know that from here, okay,  $\frac{2}{l}$ ,  $0$  to  $l$   $\int_0^l \cos \frac{n\pi x}{l} dx = \frac{1}{n}$ , okay, so  $0$  to  $l$   $U_{xt} \cos \frac{n\pi x}{l} dx = \frac{1}{2}$ , so this  $\frac{1}{2}$  we shall put for  $\frac{1}{2} C_{uxx}$ , okay, yeah, yeah, so we will write  $\frac{1}{2} C_{Uxx}$ , no,  $C_u$ , sorry,  $\frac{1}{2} C_u$  okay, so we will get that so, this  $U$  put here, for this you write  $\frac{1}{2} C_u$ , okay, so let us see what we get then.

(Refer Slide Time: 23:06)

Properties of the transforms cont...

$$= -\frac{n\pi}{l} \int_0^l u(x, t) \cos \frac{n\pi x}{l} dx$$

Hence,

$$C\{u_{xx}\} = \left[ \frac{2}{l} \left\{ \left( \frac{\partial u}{\partial x} \right)_{x=l} (-1)^n - \left( \frac{\partial u}{\partial x} \right)_{x=0} \right\} - \frac{n^2 \pi^2}{l^2} C\{u\} \right]$$

$$= \left( -\frac{n\pi}{l} \right)^2 C\{u\} - \frac{2}{l} \left[ u_x(0, t) + (-1)^{n+1} u_x(l, t) \right]$$

$-\left(\frac{n\pi}{l}\right)^2 C\{u\} - \frac{2}{l} \left[ u_x(0, t) + (-1)^{n+1} u_x(l, t) \right]$  ✓

So,  $\frac{2}{l}$  over  $l$ , okay, we have  $\frac{2}{l} U_x$  at  $x = l$   $-1$  to the power  $n$ , in minus, yeah, so  $\frac{2}{l}$  over  $l$  multiply to this as well as to this, so  $\frac{2}{l} -U_x$  at  $x = 0$ , so this is what we have okay and then  $-\frac{n^2 \pi^2}{l^2}$  over  $l^2$ , yeah, okay, so this  $\frac{2}{l}$ , when you combine with  $0$  to  $l$ , this  $\frac{2}{l}$ , when you combine with  $2$  to  $l$ ,  $U_{xt} \cos \frac{n\pi x}{l}$  gives you this one,  $C_u$ , okay, so what you get is this.

So,  $-\frac{n^2 \pi^2}{l^2}$  is square  $C_u$ , okay, so this I can write  $-\frac{n\pi}{l}$  whole square  $-\frac{n\pi}{l}$ , this  $-\frac{n\pi}{l}$  should have been here, this is actually  $-\frac{n\pi}{l}$  whole square, okay, yeah,  $-\frac{n\pi}{l}$  over  $l$

whole square  $Cu - 2$  over  $l$ , yeah,  $-2$  over  $l$ , right, we have, we can – we have taken common, so  $-2$  over  $l$  and then  $U \times 0$   $t$ , okay,  $-1$  to the power  $n$ , yeah,  $-1$  to the power  $n + 1$ , yeah, okay,  $ux$ , okay.

(Refer Slide Time: 24:47)

**Example**

Consider the PDE

$$u_{tt} = u_{xx} + \sin \pi x, \quad 0 < x < 1, t > 0,$$

$$u(0, t) = 0, u(1, t) = 0, \quad t > 0,$$

$$u(x, 0) = 1, u_t(x, 0) = 0, \quad 0 < x < 1.$$

Taking the sine transform of the given equation, we obtain

$$\frac{d^2 S[u]}{dt^2} = -n^2 \pi^2 S[u] + \frac{2}{1} \int_0^1 \sin \pi x \sin(n\pi x) dx. \quad (2)$$

Now,  $\int_0^1 \sin \pi x \sin(n\pi x) dx = \frac{1}{2} \int_0^1 [\cos(n-1)\pi x - \cos(n+1)\pi x] dx = 0, n \neq 1$

*Handwritten notes:*  
 $S[u_{tt}] = \frac{d^2 S}{dt^2}$   
 $l=1$  here  
 $2 \int_0^1 u_{tt} \sin n\pi x dx$   
 $= 2 \int_0^1 u_{xx} \sin n\pi x dx + 2 \int_0^1 \sin \pi x \sin n\pi x dx$

So,  $Cu_{xx}$  is actually = this, okay, now consider the PDE, okay, second order PDE, so  $U_{tt} = U_{xx} + \sin \pi x$ ,  $x$  varies from 0 to 1,  $t$  is  $> 0$ , so we have a finite length, okay,  $x$  varies from 0 to 1, we are given boundary conditions  $x = 0$ , at  $x = 0$ ,  $u = 0$ ,  $t$  is,  $u_{xt}$  is 0, at  $x = 1$ ,  $u_{xt}$  is 0, so we are given the digital boundary conditions, okay and when  $t = 0$ ,  $u_{x0}$  is 1 and the derivative of  $u$ ; partial derivative of  $u$  with respect to  $t$ , okay,  $u_t$  at  $t = 0$  is given to be 0, okay, for all  $x$  between 0 and 1.

So, what we do; let us take the finite transform of the given PDE, okay, taking finite transform of the given PDE means, you multiply the PDE by  $\sin n\pi x$  over  $l$  and then integrate with respect to  $x$  over the interval 0 to 1 and multiply by 2 over  $l$ , here we have  $0 < x < 1$  that means  $l = 1$  here, okay, so we multiply both sides by  $\sin n\pi x$  and then integrate with respect to  $x$  and multiply by 2 over  $l$  that is 2 over 1, so 2, okay.

So, 2 times 0 to 1  $U_{tt} \sin n\pi x dx$ , okay = 2 times 0 to 1  $U_{xx} \sin n\pi x dx + 2$  times 0 to 1  $\sin n\pi x * \sin \pi x \sin n\pi x * dx$ , okay, we multiply both sides by  $\sin n\pi x$ , integrate with respect to  $x$  over the interval 0 to 1 and multiply by 2  $\pi$ , so that will give us the Fourier's sine transform of

the given equation, okay. Now, we know that  $S$  of  $U_{tt} = d^2 S$  over  $dt^2$ , we have seen it, okay.

So, left side becomes  $d^2 S$  over  $dt^2$  and then  $S$  of  $U_{xx}$ , okay,  $S$  of  $U_{xx}$  we have already found, okay, let us see what is that. So, this is  $S$  of  $U_{xx}$ , okay,  $S$  of  $U_{xx} =$  this one,  $U_0$  is given to be 0,  $U_1$  is given to be 0, okay,  $l = 1$ , okay, so this is 0, this is 0 and  $l = 1$  means we get  $n^2 \pi^2 S$ , okay, so we get here,  $-n^2 \pi^2 S$ , okay and then this is the last term,  $2 \int_0^1 \sin \pi x \sin n \pi x dx$ .

Now, we know the property of  $\sin \pi x$ ;  $\sin \pi n x$ , okay, they are mutually orthogonal functions, okay, when  $m$  and  $n$  are not same, their integral 0 to 1 will be 0, okay, so here you can see  $\int_0^1 \sin \pi x \sin n \pi x dx$ , this is 0, whenever  $n \neq 1$ , okay and when  $n = 1$ , we will get  $\int_0^1 \sin^2 \pi x dx$  that value we can calculate separately, okay, so this is 0, this integral is 0, when  $n \neq 1$ .

(Refer Slide Time: 28:28)

Example cont...

When  $n = 1$ , we get

$$\int_0^1 \sin^2 \pi x dx = \frac{1}{2} \checkmark \quad S_n(0) = 2 \int_0^1 \sin \pi x dx$$

Hence

$$\frac{d^2 S[u]}{dt^2} = \begin{cases} -n^2 \pi^2 S[u] + 1, & n = 1, \\ -n^2 \pi^2 S[u], & n \neq 1. \end{cases} \quad (3)$$

Now,

$$S[u] = S_n(t) = \frac{2}{l} \int_0^l u(x, t) \sin \frac{n\pi x}{l} dx,$$

$$S_n(0) = 2 \int_0^1 u(x, 0) \sin n\pi x dx = \begin{cases} \frac{4}{n\pi}, & n \text{ is odd} \checkmark \\ 0, & n \text{ is even.} \end{cases} \quad (4)$$

And when  $n = 1$ , we get  $\int_0^1 \sin^2 \pi x dx$ , we can easily integrate  $\sin^2 \pi x$ , put the limits and see that it is  $1/2$  okay, so what do we notice now; we noticed that this quantity becomes 0 when  $n \neq 1$ , okay and when  $n = 1$ , this becomes  $1/2$  okay, so we have 2 cases, this equation for  $n = 1$  and this equation for  $n \neq 1$ , okay. So, let us first, so let us see,  $d^2 S$  over  $dt^2$

over  $dt^2 = -\pi^2 S_n$ , when  $n = 1$ , okay  $d^2 S_n / dt^2$  will be  $-\pi^2 S_n + 2 \times 1$ .

So, we will get  $d^2 S_n / dt^2 = -\pi^2 S_n + 1$ , okay, so  $-\pi^2 S_n + 1$ , okay, so this is for  $n = 1$ , okay and then for  $n \neq 1$ , this part becomes 0, so we get  $d^2 S_n / dt^2 = -n^2 \pi^2 S_n$ , okay, so this is the value when  $n \neq 1$ , this value we have when  $n = 1$ , okay. Now, by our definition of sin transform,  $\pi^2 S_n$  is nothing but  $S_n(t)$  and this is  $2 \int_0^1 U(x,t) \sin n\pi x dx$ , okay.

So, from here you can see, if you put  $t = 0$ , okay if you put  $t = 0$ , what you get;  $1 = 1$  in our case, so  $2 \int_0^1 U(x,0) \sin n\pi x dx$ , okay and what we are given  $U(x,0)$  as  $U(x,0) = 1$ , okay, so what we have;  $S_n(0) = 2 \int_0^1 U(x,0) \sin n\pi x dx$ , so this is  $4/n\pi$ , when  $n$  is odd and 0 when  $n$  is even, okay, so this is  $4/n\pi$ , when  $n$  is an odd integer and 0 when  $n$  is even, okay.

(Refer Slide Time: 30:50)

Example cont...

$$\frac{d}{dt} S_n(t)|_{t=0} = \frac{2}{l} \int_0^l \frac{\partial}{\partial t} u(x,t)|_{t=0} \sin \frac{n\pi x}{l} dx,$$

$$= 2 \int_0^1 u_t(x,0) \sin n\pi x dx = 0.$$

Thus from (1) we obtain

$$S_1''(t) = -\pi^2 S_1(t) + 1 \quad (6)$$

$$S_n''(t) = -(n\pi)^2 S_n(t), \quad n = 2, 3, 4, \dots \quad (7)$$

The general solution of (6) is  $S_1(t) = A \cos \pi t + B \sin \pi t + \frac{1}{\pi^2}$ ,  
in view of (5), we get  $A = (\frac{4}{\pi} - \frac{1}{\pi^2})$ ,  $B = 0$ .  
Thus  $S_1(t) = (\frac{4}{\pi} - \frac{1}{\pi^2}) \cos \pi t + \frac{1}{\pi^2}$ .

Handwritten notes on the right side of the slide:

- $\frac{d}{dt} S_1(t) = A(-\sin \pi t) \pi$
- $\frac{d}{dt} S_1(t)|_{t=0} = A(-\sin 0) \pi = 0$
- $A = \frac{4}{\pi} - \frac{1}{\pi^2}$
- $S_1(0) = A + \frac{1}{\pi^2}$
- $\frac{4}{\pi} = A + \frac{1}{\pi^2}$

So, this value we know right, now  $d/dt$  of  $S_n(t)$ , when you differentiate  $S_n(t)$  with respect to  $t$ , since  $t$  and  $x$  are independent, we have  $2 \int_0^1 U_t(x,t) dx$ , okay  $U_t(x,t)$  and then you put  $t = 0$ , okay, so  $d/dt S_n(t)$  at  $t = 0$  is  $2 \int_0^1 U_t(x,0) dx = 0$ , so  $U_t(x,0) = 0$  for all  $x$ , so  $U_t(x,0)$  is given to be 0 at  $t = 0$ , so we have this, this quantity becomes 0.

So, we get  $\frac{d}{dt}$  of  $S_n t$  at  $t = 0$  as 0, now then what do we get; okay, this double dash means, this dash actually denotes the derivative with respect to  $t$ , now we have ordinary differential equations, this ordinary differential equation of second order,  $\frac{d^2 S}{dt^2} = -n^2 \pi^2 S + 1$  or you have  $\frac{d^2 S}{dt^2} = -n^2 \pi^2 S$ , okay they are second order differential equations, okay.

So, what we have;  $S_1''(t) = -\pi^2 S_1(t) + 1$ , this is for the case  $n = 1$ , okay, so we have this and the for  $n = 2, 3, 4$  and so on, when  $n \neq 1$ , we have  $S'' = -n^2 \pi^2 S$ , okay, so  $S'' = -n^2 \pi^2 S_n t$  okay. Now, general solution of this equation, this if you want to simplify, let us find the general solution of this.

**(Refer Slide Time: 32:35)**

$$\begin{aligned}
 S_1''(t) &= -\pi^2 S_1(t) + 1 & y'' + \pi^2 y &= 1 \\
 S_1''(t) + \pi^2 S_1(t) &= 1 \\
 \text{A.E. } m^2 + \pi^2 &= 0 & y' + \pi^2 y &= 1 \\
 m &= \pm \pi i \\
 \text{Thus, } S_1(t) &= A \cos \pi t + B \sin \pi t + \frac{1}{\pi^2} & D &\equiv \frac{d}{dt} \\
 \text{P.I.} &= \frac{1}{D^2 + \pi^2} \cdot 1 \\
 &= \frac{1}{\pi^2} \left[ 1 + \frac{D^2}{\pi^2} \right]^{-1} \cdot 1 \\
 &= \frac{1}{\pi^2} \left[ 1 - \frac{D^2}{\pi^2} + \frac{D^4}{\pi^4} - \dots \right] \cdot 1 \\
 &= \frac{1}{\pi^2} [1 + 0] = \frac{1}{\pi^2}
 \end{aligned}$$

We have  $S_1''(t) = -\pi^2 S_1(t) + 1$ , okay, so I can write it as  $S_1''(t) + \pi^2 S_1(t) = 1$ , okay, so this is of the form  $y'' + \pi^2 y = 1$ , okay and we know how to solve this second order ODE with constant coefficients, okay, we write auxiliary equations, auxiliary equation is  $m^2 + \pi^2 = 0$ , okay, so  $m = \pm \pi i$ , okay, we have complex roots, okay.

So, complementary function is  $A \cos \pi x + B \sin \pi x$ , okay, particular integral let us find, particular integral we can find by  $1$  over  $D^2 + \pi^2$  operating on  $1$ ,  $D$  is  $\frac{d}{dt}$ , so I

can write it as  $\frac{1}{\pi^2}$  times  $1 + D^2$  over  $\pi^2 - 1$  operating on 1, now this is  $\frac{1}{\pi^2}$ , we can write the infinite series expansion of this,  $\frac{d^2}{\pi^4} + \frac{D^4}{\pi^6}$  and so on, okay operating on 1.

And these derivative with respect to  $t$ , okay, so  $\frac{1}{\pi^2}$ ,  $1 * 1$  is 1, all of these derivative; these second order derivative is fourth other derivatives, so they are all zeros, okay, so we have  $\frac{1}{\pi^2}$ , so thus  $S_1 t$ , okay, the general solution  $S_1 t$  will be  $= A \cos \pi t$ , this will be  $t$  not  $x$  because we have derivative with respect to  $t$ , okay, so  $A \cos \pi t + B \sin \pi t + \frac{1}{\pi^2}$ , okay, so we have this.

$S_n t =$ ;  $S_1 t = A \cos \pi t + B \sin \pi t + \frac{1}{\pi^2}$ , now here let us see, when you put  $t=0$ , okay, when you put  $t=0$   $S_1 0$  is how much;  $A + \frac{1}{\pi^2}$  upon  $\pi^2$ ,  $S_1 0$  we found earlier, yeah from here  $S_1 0$ ,  $n = 1$ , okay,  $S_1 0$  is  $\frac{4}{\pi}$ , okay, so this  $\frac{4}{\pi}$ ,  $S_1 0$  is  $\frac{4}{\pi} = A + \frac{1}{\pi^2}$ , so  $A = \frac{4}{\pi} - \frac{1}{\pi^2}$ , okay and so we have found the value of  $A$ , to obtain the value of  $B$ , let us differentiate this equation with respect to  $t$ .

So,  $\frac{d}{dt}$  of  $S_1 t =$ ;  $A$  is  $A$  times  $\cos \pi t$ , so  $A * -\sin \pi t * \pi$ , okay  $+ B \pi \cos \pi t$ , okay, so when you put  $t = 0$ , what we get;  $\frac{d}{dt}$  of  $S_1 t$  at  $t=0$  gives you this is  $0 - 4B\pi$  but  $\frac{d}{dt}$  of  $S_n t$  at  $t=0$  is 0, this is valid for all  $n$ , okay, so  $\frac{d}{dt}$  of  $S_n t$  at  $t=0$  is 0, so we get this, so with these gives you  $B = 0$ , okay, so  $B$  is 0, okay,  $A$  is  $\frac{4}{\pi} - \frac{1}{\pi^2}$ , so we get the value of  $S_1 t$ ;  $S_1 t$  is  $\frac{4}{\pi} - \frac{1}{\pi^2} \cos \pi t + \frac{1}{\pi^2}$ , okay.

**(Refer Slide Time: 36:56)**

### Example cont...

The general solution of (7) is  $S_n(t) = C \cos n\pi t + D \sin n\pi t$ .

Now

$$S_n(0) = C = \begin{cases} \frac{4}{n\pi}, & n = 3, 5, 7, \dots \\ 0, & n = 2, 4, 6, \dots \end{cases}$$

and  $S'_n(0) = 0 \Rightarrow D = 0, \forall n$ .

Hence

$$S_n(t) = \begin{cases} \frac{4}{n\pi} \cos n\pi t, & n = 3, 5, 7, \dots \\ 0, & n = 2, 4, 6, \dots \end{cases}$$

Now, applying the inverse sine transform

$$u(x, t) = \sum_{n=1}^{\infty} S_n(t) \sin n\pi x$$

$$S_n''(t) + n^2\pi^2 S_n(t) = 0$$

$$y'' + a^2 y = 0$$

$$y = A \cos at + B \sin at$$

$$S_n(t) = A \cos n\pi t + B \sin n\pi t$$

$$S_n(0) = C$$

$$S_n(0) = \begin{cases} \frac{4}{n\pi}, & n \text{ odd} \\ 0, & n \text{ even} \end{cases}$$

Now, let us find the general solution of the partial differential equation for the other values of  $n$ ,  $n = 1$  we have solved, let us find the value for a solution for other values of  $n$ , so  $S_n$  double dash  $t = -n^2 \pi^2 S_n t$ , okay, so we have  $S_n$  double dash  $t + n^2 \pi^2 S_n t = 0$ , so this is of the form  $y$  double dash  $+ A^2 = 0$ , okay, so we know that the general solution is  $A \cos at + B \sin at$ , okay in this case because right side is 0, so particular integral is 0, okay, so here  $S_n t$  will be  $= A \cos; A = n\pi$ , okay, so  $n\pi t + B \sin n\pi t$ , okay, this.

Now, let us see we have  $S_n 0 =$ ; if you put  $n 0$  here,  $S_n 0 = c$ , okay, this is 1, so  $C$  and this is 0,  $S_n 0 = c$  and  $c = S_n 0$  we have already found,  $S_n 0 = 4$  over  $n\pi$  when  $n$  is odd, okay and 0 when  $n$  is even, okay, so  $S_n 0 =$ ; let us recall for 4 over  $n\pi$  when  $n$  is odd and 0 when  $n$  is even, okay,  $n = 1$  case we have already considered, so when  $n$  takes value 3, 5, 7,  $S_n 0$  is 4 over  $n\pi$  and for  $n$  even that is 2, 4, 6  $S_n 0$  is 0, okay.

So, this value is known to us, so this gives you the value of  $c$ ,  $c$  is 4 over  $n\pi$  for  $n = 3, 5, 7$ ; 0 for  $n = 2, 4, 6$ ,  $S_n$  dash  $t$  will be  $=$  what;  $-c\pi \sin n\pi t$ ,  $n$  also will come, so this will be  $-cn\pi$ ;  $cn\pi \sin n\pi t + Dn\pi \cos n\pi t$ , now  $t = 0$ , so  $S_n$  dash  $t, t = 0 = dn\pi$  and  $S_n$  dash  $t$  at  $t = 0$  is 0, so we get  $d = 0$ , okay, so  $d = 0$  for all  $n$ , all right. Now,  $S_n t =$  then so put the value of  $c$  4 over  $n\pi \cos n\pi t$   $d 0$  and this is the value, when  $n$  is 3, 5, 7 and 0 when  $n$  is 2, 4, 6, okay.

Now, apply the inverse sine transform, okay, when you apply the inverse sine transform, you get  $U(x,t)$ ; okay, let us see that one, inverse sine transform, this is inverse sine transform, okay,  $f(x) = \sum_{n=1}^{\infty} S_n \sin n\pi x$  over  $l$ ,  $l=1$  here okay,  $f(x)$  is  $U(x,t)$ , so we have  $U(x,t) = \sum_{n=1}^{\infty} S_n t \sin n\pi x$  over  $l$ ,  $S_n t$  is  $\frac{4}{n\pi} \cos n\pi t$ , we will write the value of  $S_n t$  for  $n=1$  separately, okay because that is separate case, this one, okay.

**(Refer Slide Time: 40:41)**

Example cont...

$$u(x,t) = \left[ \left( \frac{4}{\pi} - \frac{1}{\pi^2} \right) \cos \pi t + \frac{1}{\pi^2} \right] \sin \pi x + \frac{4}{\pi} \sum_{n=1}^{\infty} \frac{1}{2n+1} \cos \{(2n+1)\pi t\} \sin \{(2n+1)\pi x\}. \quad \checkmark$$

So, let us write that so,  $u(x,t)$  is;  $S_1 t$  is this one,  $\frac{4}{\pi} - \frac{1}{\pi^2} \cos \pi t + \frac{1}{\pi^2}$  square, okay, this one, okay, this is  $S_1 t * \sin \pi x$  and then we write for odd values of  $n$ , okay, this one, for  $n=3, 5, 7$ , we put  $n=2m+1$ , so then  $m$  will take values of 1, 2, 3, 4, 5, 6 and so on, okay, so this will become  $\frac{4}{2m+1} \cos 2m+1 \pi t$ , okay and we multiply by  $\sin n\pi x$ , so  $\sin 2m+1 \pi x$ , okay.

And summation will run over  $m$  from 1, 2, 3, 4 and so on up to infinity, so we get sigma,  $\frac{4}{\pi}$  we can write outside, okay  $\frac{4}{\pi}$  and then sigma  $n$ ; so in place of  $m$ , now we have written  $n$ , so  $\frac{1}{2n+1} \cos 2n+1 \pi t \sin 2n+1 \pi x$ , okay, so this is how we solve the second order PDE by finite sine transform, okay.

**(Refer Slide Time: 42:08)**

### Example 2

Find the steady-state temperature distribution  $u(x, y)$  in a long square bar of side  $\pi$  with one face maintained at constant temperature  $u_0$  and the other faces at zero temperature.

**Solution:** We have  $u_{xx} + u_{yy} = 0, 0 < x < \pi, 0 < y < \pi$ .

$$u(0, y) = u(\pi, y) = 0$$

$$u(x, 0) = 0, u(x, \pi) = u_0.$$

Taking the finite Fourier transform of the given PDE with respect to the variable  $x$ , we have

$$\frac{2}{\pi} \int_0^\pi \frac{\partial^2 u}{\partial x^2} \sin\left(\frac{n\pi x}{\pi}\right) dx + \frac{2}{\pi} \int_0^\pi u_{yy} \sin\left(\frac{n\pi x}{\pi}\right) dx = 0$$

$$S[u(x, y)]_{y=0} = A$$

$$0 = A$$

$$\frac{d^2 S[u]}{dy^2} - n^2 S[u] = 0.$$

$$\Rightarrow S[u] = A \cosh ny + B \sinh ny$$

$$m^2 - n^2 = 0$$

$$m = \pm n$$

$$S[u] = A e^{ny} + B e^{-ny}$$

$$= A (\cosh ny + \sinh ny) + B (\cosh ny - \sinh ny)$$

(8)

Now, let us look at one more problem; find the steady state temperature distribution  $u(x, y)$  in a long square bar of side  $\pi$ , okay, so we have a long square bar of side  $\pi$ , okay this is side  $\pi$ , okay, long square bar of side  $\pi$  with one face maintained at constant temperature  $u_0$ ,  $u(x, y) = u_0$ , we have taken this, this face, this is face  $u(x, y)$  okay, this face  $u(x, y)$  is taken as  $u_0$ , while other faces, this is  $u_0 = 0$ , okay,  $u_0 = 0$  is taken 0,  $u(\pi, y)$  is taken 0 here.

Here  $u(x, 0) = 0$ , okay, so this side, this side, this side, these 3 sides are taken at 0 temperature, this 4 side we take at temperature  $u_0$ , okay, so one face maintained at temperature  $u_0$ , other faces are taken as temperature 0, so we have this, in the steady state in 2 dimensions, we have this Laplace equation, so  $u_{xx} + u_{yy} = 0$ ,  $x$  varies from 0 to  $\pi$ ,  $y$  varies from 0 to  $\pi$ . When  $x$  is 0;  $x$  is 0 means this  $y$  axis, okay.

So,  $u_0 = 0$ , when  $x$  is  $\pi$ , this face okay, parallel to  $y$  axis, so this is 0 and then  $u_0 = x$  that is the segment on  $x$  axis, so this  $u_0 = x = 0$  and then this face is taken a temperature  $u_0$ . Now, taking the finite sine transform of the given equation because here also we have Dirichlet boundary conditions, so we multiply the given equation by  $\sin n\pi x$  over  $\pi$ , we take as  $y$  as we are treating as  $t$ , okay here.

So, we multiply the given equation by  $\sin n\pi x$  over  $\pi$ ;  $\pi$  is  $\pi$  here, so  $\sin n\pi x$  over  $\pi$  and integrate with respect to  $x$  and multiply by 2 over  $\pi$  that is 2 over  $\pi$ , so 2 over  $\pi$  0 to  $\pi$ ,  $u_{xx} \sin$

$\int_0^l \sin \frac{n\pi x}{l} dx = 0$ , then  $\int_0^l u_{yy} \sin \frac{n\pi x}{l} dx = \text{right side is } 0$ . Now, this is what since we have this  $u_{xx}$ , okay,  $u_{xx}$ , let us look at the formula for that as  $u_{xx}$ , so this is  $u_{xx}$ , okay.

We are treating that  $y$  as  $t$ , this  $t$  here is treated as  $y$  there, so at  $x=0$ , temperature is 0, at  $x=l$ , temperature is again 0, so this is 0, this is 0, so we have; so this means that  $u_{xx} = -\frac{n^2\pi^2}{l^2} u$ , okay,  $l$  is  $\pi$ , so this is  $-n^2$   $u$  there, so we get  $-n^2$   $u$  this one, okay, corresponding to this term and here this derivative with respect to  $y$ ; second order derivative with respect to  $y$ , okay can be written outside the integral.

Because  $x$  and  $y$  are independent variable and then we have  $\frac{d^2 u}{dy^2}$  because as I said, we are treating this  $y$  as  $t$ , okay, so  $\frac{d^2 u}{dy^2} - n^2 u = 0$  and this is equation of the ordinary differential equation of the second order with constant coefficients, so auxiliary equation is  $m^2 - n^2 = 0$ , so  $m = \pm n$ , so we have 2 distinct real roots and therefore,  $u$  will be  $= A \cosh ny + B \sinh ny$ .

Actually, we also write  $u$  as  $Ae^{ny} + Be^{-ny}$  but we can convert it to  $\cosh$  and  $\sinh$  functions writing as  $A \cosh ny + B \sinh ny$  and  $B \sinh ny$  as  $\cosh ny - \sinh ny$ , so collecting the coefficients of  $\cosh ny$  and  $\sinh ny$  and using new arbitrary constant, we can write  $u$  as this, okay.

**(Refer Slide Time: 46:45)**

### Example 2 cont...

Since  $u(x, 0) = 0 \Rightarrow A = 0$  and  $u(x, \pi) = u_0 \Rightarrow B = \frac{2u_0 (1 - \cos n\pi)}{n\pi \sinh n\pi}$ .

Hence taking the inverse sine transform

$$S[u] = \frac{2}{\pi} \int_0^\pi u(x, y) \sin nx \, dx$$

$$S[u] = \frac{2}{\pi} \int_0^\pi u(x, y) \sin nx \, dx = \sum_{n \text{ is odd}} \frac{4u_0}{n\pi \sinh n\pi} \sin nx \sinh ny$$

$$u(x, y) = \frac{4u_0}{\pi} \sum_{n=1}^{\infty} \frac{\sinh(2n-1)y \sin(2n-1)x}{(2n-1) \sinh(2n-1)\pi}$$

where  $y < \pi$

when  $y = 0$ ,  $u(x, 0) = 0$  because  $\sinh(0) = 0$

when  $y = \pi$ ,  $u(x, \pi) = u_0$  because  $\sinh(\pi) = \sinh(\pi)$

Now, since we are given, since here  $Su$  is  $A \cos$  hyperbolic  $ny$ , we are giving  $u_y = 0$ , okay, we are given  $u_x = 0$ , then  $y$  is 0, okay, when  $y$  is 0,  $u_x = 0$ , so this is  $x = 0$ , this is  $x = \pi$ , this is; this will be  $u_x = 0$ , okay, so  $u_x = 0 = 0$ , okay. Now, what we have;  $Su$  of  $u$ ,  $S$  of  $u = 2$  over  $\pi$   $\int_0^\pi u(x, y) \sin nx \, dx$ , okay, this  $\pi$  is cancel with this  $\pi$ , we have  $2$  over  $\pi$   $\int_0^\pi u(x, y) \sin nx \, dx$ , okay. Now, put  $y = 0$  here, okay, so then this is a function of  $y$ , okay.

$Su$  is a function of  $y$ , so actually we have  $S$  of  $u_y$  there, so  $S$  of  $u_y$  actually we have, you can also write it as  $S_n y$ , so this =  $S_n y$ , when you take  $y = 0$ , what we get;  $S_n y = 0$ , when  $y = 0$  because  $u_x = 0$ , when you put  $y = 0$  here, we are given that  $u_x = 0$ , so  $Su y$  that is  $S_n y$  is 0 okay, so now this value put here,  $Su y$ , okay, this you put  $y = 0$  here,  $\sinh$  hyperbolic  $ny$  is 0, so we get  $n \cos$  hyperbolic  $ny$  is 1, so  $A = Su y$  at  $y = 0$  which is  $S_n 0$ , okay.

So,  $Su y$  at  $y = 0 = A$ , okay but this is 0, so we get  $A = 0$ , okay. Now we have the other boundary condition,  $y = \pi$ , when  $y = \pi$  for all  $x$  from 0 to  $\pi$ ,  $u(x, \pi) = u_0$ , okay, so this will give us the value of  $B$ , okay, so here in this you put  $y$  as now  $\pi$ , okay,  $A$  is 0, so  $S \pi$ ;  $Su y$  at  $y = \pi$ , this given as  $u_0$  and this is  $= 2$  over  $\pi$ , okay 0 to; okay, no not this, we will have right side, okay,  $y = \pi$ , so  $B \sinh$  hyperbolic  $n \pi$ .

So,  $B = u_0$  over; here  $\sinh Su y$  at  $y = \pi$  is not  $u_0$ , actually it is  $2$  over  $\pi$   $\int_0^\pi u(x, y) \sin nx \, dx$ , okay, so this is actually  $u_0$ , so  $2$  over  $\pi$   $u_0$  and we

have  $0$  to  $\pi$   $\sin n \pi x$   $dx$  that we have to evaluate, so  $B$  is  $\frac{2}{\pi} u_0$  upon  $\pi$  times  $\sin$  hyperbolic  $n \pi$  and then we integrate  $\sin nx$ , so  $-\cos nx$  divided by  $n$ ,  $0$  to  $\pi$ , okay, so this will give you  $\frac{2u_0}{n\pi} \sin \text{hyperbolic } n\pi - \cos n\pi$ , okay.

So, this will be  $0$ , when  $n$  is even, okay because  $\cos n\pi$  will be  $1$  and this will be  $\frac{4u_0}{n\pi} \sin \text{hyperbolic } n\pi$ , when  $n$  is even; odd, okay because  $\cos n\pi$  will be  $-1$ , so you replace  $n$  by  $2n - 1$ , okay, then  $n$  will run from  $1$  to infinity, so  $u(x,y)$  will be  $=$ ; we take inverse finite transform, okay to write  $u(x,y)$ ,  $u(x,y) = \sum_{n=1}^{\infty} S_n \sin n\pi x \int_0^{\pi} dx$ , okay  $u(x,y)$ , sorry  $u(x,y) = \sum_{n=1}^{\infty} S_n \sin n\pi x \int_0^{\pi} dx$ ;  $n\pi x$  over  $\pi$ , so  $\sin nx$ , okay.

$S_n$  is this,  $S_n$  is this value okay, so  $S_n$  is  $B \cos \sin \text{hyperbolic } n\pi$  and  $B$  we have found here, so this  $\frac{4u_0}{\pi}$  divided by  $\pi$ , okay, summation  $n$  is replaced by  $2n - 1$ , so that  $n$  runs from  $1$  to infinity, so  $\frac{1}{2n - 1}$ , okay  $\sin \text{hyperbolic } 2n - 1 \pi$  and then we have  $\sin \text{hyperbolic } 2n - 1 y * 2n - 1 x$ , okay, oh here, so we have found value of  $B$  and then from  $B$ , we find the value of  $S_n$ , okay,  $S_n$  is found from here after putting the values of  $p$ .

Once we have  $S_n$  here, we can then write inverse finite sine transform by  $u(x,y) = \sum_{n=1}^{\infty} S_n \sin nx$ ;  $\sin nx$  and  $S_u(y)$  as I said  $S_u(y)$  is  $\int_0^{\pi} \frac{2}{\pi} u(x,y) \sin nx dx$ , okay that is  $S_n(y)$ , okay, this  $S_n(y)$  okay. So, from here we get the value of  $S_n(u)$ ;  $S_n(u)$  is  $S_n(y)$ , when we want to calculate  $S_n(y)$ , okay in order to get the value of  $B$ , we get the value of  $B$  is found from here by putting  $y$  as  $\pi$ , okay.

So, this is the value of  $S$ , then we get the value of  $S_n$ , okay,  $S_n =$  this,  $B =$  yeah, right, so this is how we find the value of this. Now, this is how we solve the second partial differential equation; Laplace equation in the case of square plate, okay whose one is at  $u_0$  temperature, one face is at  $u_0$  temperature and the other faces are at  $0$  temperature, so this is how we solve the equation. Thank you very much for your attention.
