Lecture – 03
Vector Subspaces, their Examples and Properties

Hello friends. So, welcome to the lecture 3 of this course Essential Mathematics for Machine Learning. So, in the last lecture, we have seen the definition of vector spaces, some of the example of vector spaces. In this lecture, we will learn about Vector Subspaces, their some of their Examples and Properties. Again, our field will be the field of real numbers that is \mathbb{R} .

(Refer Slide Time: 00:52)

Subspaces of \mathbb{R}^n

Definition: If \mathbb{R}^n is a vector space over \mathbb{R} , then a subset S of \mathbb{R}^n is said to be a subspace of vector space \mathbb{R}^n , if S is also a vector space over the same field \mathbb{R} .

Aliter

If \mathbb{R}^n is a vector space, then $S \subseteq \mathbb{R}^n$ is said to be a subspace of $V = \mathbb{R}^n(\mathbb{R})$ if

- a) $0 \in S$
- b) S is closed under vector addition: $x, y \in S$ implies $x + y \in S$
- c) S is closed under scalar multiplication: $x \in S, \alpha \in \mathbb{R}$ implies $\alpha x \in S$

 IIT ROORKEE  NPTEL ONLINE
CERTIFICATION COURSE

2

So, we start with the definition of subspaces. So, if \mathbb{R}^n is a vector space over \mathbb{R} . So, here we are saying vector space \mathbb{R}^n , but in general it can be any vector space V . Then a subset of \mathbb{R}^n is said to be a subspace of vector space \mathbb{R}^n , if S is also a vector space over the same field \mathbb{R}

means the set of vectors of S also satisfy all those six properties which we have given in the definition of vector space.

As I told you, here I am writing \mathbb{R}^n due to machine learning application because in machine learning, we will see usually the vector space \mathbb{R}^n where n may be any integers. However, the definition holds for any vector space V over the field F .

The alternate definition of this can be given as if \mathbb{R}^n is a vector space, then a subset S of \mathbb{R}^n is said to be a subspace of \mathbb{R}^n over the field \mathbb{R} if the 0 vector belongs to S so, whatever 0 vector we are having for V or \mathbb{R}^n that is also part of S . S is closed under vector addition that is if x, y are two vectors from S , then their addition $x + y$ is also a vector in S and S is closed under scalar multiplication means if you take a vector x from S and a scalar α from the field \mathbb{R} , then αx which should be again a vector of S . So, this is the definition of subspaces.

(Refer Slide Time: 03:06)

Theorem:

Let W be a subset of \mathbb{R}^n . Then W is a subspace of \mathbb{R}^n if and only if the following conditions hold:

- (a) W is non-empty.
- (b) For any $a, b \in \mathbb{R}$ and any $\vec{u}, \vec{v} \in W$,
$$a \vec{u} + b \vec{v} \in W$$

\square

NPTEL ONLINE
CERTIFICATION COURSE

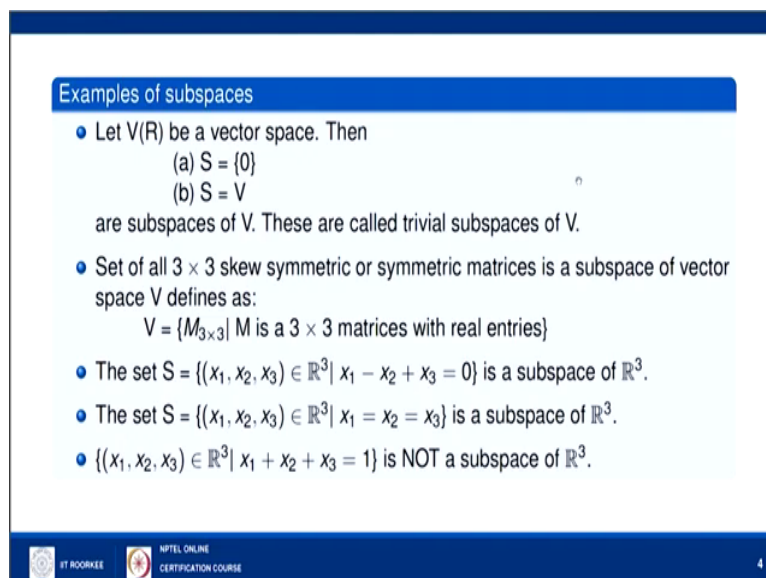

3

We are having a very important result about subspaces that is which is coming from the alternate definition only that let W be a subset of \mathbb{R}^n . Then W is a subspace of \mathbb{R}^n over the same field if and only if the following conditions hold. The first condition is W is non-empty and from where we are looking it that there should be 0 vector in W .

So, if there will be 0 vector, it will not be empty. Then, if you take any two scalars a, b belongs to \mathbb{R} and two vectors u, v from W , then a times u from the previous definition a times u is again a vector of W . If W is a subspace, b times v is again a vector of W because W is a subspace, then a plus b v is also a vector of w .

So, this particular theorem is just coming from the definition which we have seen in earlier slide that is the alternate definition. We can see from these three properties; we can show all six properties of a vector space. So, these three properties implies all those six properties.

(Refer Slide Time: 04:42)

Examples of subspaces

- Let $V(R)$ be a vector space. Then
 - (a) $S = \{0\}$
 - (b) $S = V$are subspaces of V . These are called trivial subspaces of V .
- Set of all 3×3 skew symmetric or symmetric matrices is a subspace of vector space V defines as:
 $V = \{M_{3 \times 3} \mid M \text{ is a } 3 \times 3 \text{ matrices with real entries}\}$
- The set $S = \{(x_1, x_2, x_3) \in \mathbb{R}^3 \mid x_1 - x_2 + x_3 = 0\}$ is a subspace of \mathbb{R}^3 .
- The set $S = \{(x_1, x_2, x_3) \in \mathbb{R}^3 \mid x_1 = x_2 = x_3\}$ is a subspace of \mathbb{R}^3 .
- $\{(x_1, x_2, x_3) \in \mathbb{R}^3 \mid x_1 + x_2 + x_3 = 1\}$ is NOT a subspace of \mathbb{R}^3 .

NPTEL ONLINE
CERTIFICATION COURSE

4

Now, come to the example of a subspaces. So, if V be a vector space over the field R then, S equals to 0 means S is the subset of V containing only 0 vector and S equals to V the whole set V are subspaces of V . This sub spaces are called trivial subspaces of v .

Set of all 3 by 3 skew schematic or symmetric matrices is a subspace of a vector space V define as V equals to $M_{3 \times 3}$. So, like all 3 by 3 matrices having real entries forms a vector space if you take subset of the set of all 3 by 3 matrices, let us say a subset containing all the symmetric matrices, then this set will form a subspace of the earlier vector space. Similarly, the set S x_1, x_2, x_3 belongs to R^3 where $x_1 - x_2 + x_3$ equals to 0 is a subspace of R^3 .

(Refer Slide Time: 06:09)

$S = \{(x_1, x_2, x_3) \mid x_1 + x_2 - x_3 = 0\}$ is a
 $\in \mathbb{R}^3$
subspace of \mathbb{R}^3 .

→ The zero vector of \mathbb{R}^3 is $(0, 0, 0)$ which is
a vector in S also $\Rightarrow S$ is non-empty.

→ Let $a, b \in \mathbb{R}$ and $(x_1, x_2, x_3), (y_1, y_2, y_3)$
are two vectors in S , then
 $x_1 + x_2 - x_3 = 0$, $y_1 + y_2 - y_3 = 0$

Let us try to show it. So, we are saying that the set S which is having element x_1, x_2, x_3 such that $x_1 + x_2 - x_3 = 0$. So, these belongs to \mathbb{R}^3 is a subspace of \mathbb{R}^3 . So, how to show it? So, we will say first the zero vector of \mathbb{R}^3 is given by $0, 0, 0$ the origin of three-dimensional coordinate space.

Now, here x_1 is $0, x_2$ is $0, x_3$ is 0 . So, if I take $0 + 0 - 0$ it will be 0 only which is a vector in S also this implies S is non-empty. Now, let a, b are two scalars belongs to \mathbb{R} and $x_1, x_2, x_3, y_1, y_2, y_3$ are two vectors in S , then what we are having since x_1, x_2, x_3 is a vector in S so, $x_1 + x_2 - x_3 = 0$ and y_1, y_2, y_3 is also a vector in S so, $y_1 + y_2 - y_3 = 0$.

(Refer Slide Time: 08:47)

$$\begin{aligned} \frac{a(x_1, x_2, x_3) + b(y_1, y_2, y_3)}{\in S} &= (ax_1, ax_2, ax_3) + (by_1, by_2, by_3) \\ \Rightarrow (\underline{ax_1 + by_1}, \underline{ax_2 + by_2}, \underline{ax_3 + by_3}) \\ \frac{a(x_1 + x_2) + b(y_1 + y_2) - (ax_3 + by_3)}{=} &= a(x_1 + x_2 - x_3) + b(y_1 + y_2 - y_3) \\ &= a \cdot 0 + b \cdot 0 \\ &= \underline{0} \Rightarrow S \text{ is a subspace of } \mathbb{R}^3 \end{aligned}$$

Now, a times x_1, x_2, x_3 plus b times y_1, y_2, y_3 . So, what we are having here we have to show that it is also a vector of S . So, it will become ax_1, ax_2, ax_3 plus by_1, by_2, by_3 . It is ax_1 plus by_1, ax_2 plus by_2, ax_3 plus by_3 . So, to be this vector in S this component plus this component minus this component must be 0. So, let us see.

So, we are saying $a x_1$ plus x_2 plus $b y_1$ plus y_2 minus the third component. So, I have written these this particular thing as the sum of these two vectors. This equals to a times x_1 plus x_2 minus x_3 plus because x_1 plus x_2 from here and x_3 is coming from here b times y_1 plus y_2 minus y_3 . This equals to a time 0 plus b time 0 because x_1, x_2, x_3 is a vector of S so, x_1 plus x_2 minus x_3 is 0. Similarly, y_1, y_2, y_3 is a vector of S so, y_1 plus y_2 minus y_3 is 0 and this equals to 0. It implies this addition is also belongs to S .

So, if I take any two arbitrary vector of S and the two scalars a and b , a times first vector plus b times second vector is also an element of S . So, from the previous result, we are saying that the set S is non-empty because zero vector is there and then, it is satisfying for any two vectors u and v and the two scalars a and b , $a u + b v$ is also an element of S . So, hence S is a subspace of \mathbb{R}^3 .

In the same way, the set $S = \{x_1, x_2, x_3 \mid x_1 = x_2 = x_3\}$ belongs to \mathbb{R}^3 where $x_1 = x_2 = x_3$ is also a subspace of \mathbb{R}^3 . So, what kind of vectors we will be having in this subspace where all the three components are equal means the first components, second components, third components α, α, α where α is a real number. So, certainly $0, 0, 0$ when you take $\alpha = 0$ will be there. So, S is non-empty.

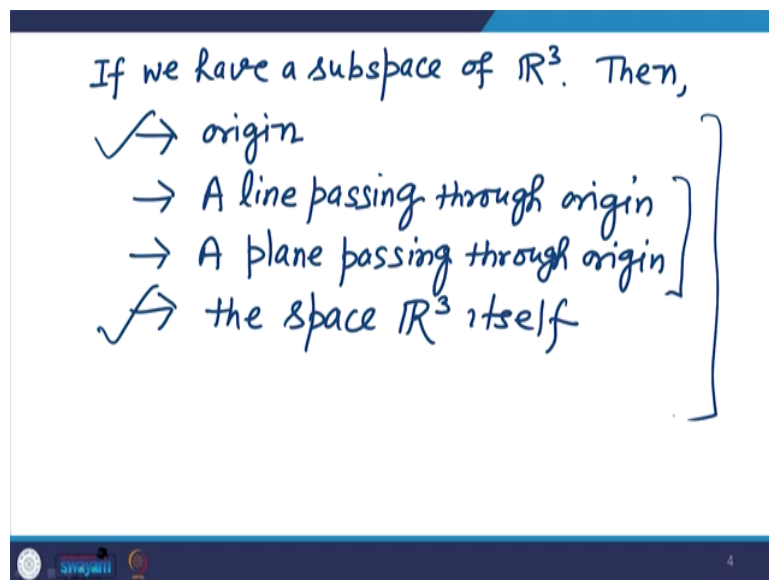

Now, if you take two vectors α, α, α and β, β, β then the sum will become $\alpha + \beta, \alpha + \beta, \alpha + \beta$ so, all the three components are equal. So, then the sum is also a vector in S . Similarly, if you take any x_1, x_2, x_3 and multiply with α let us say a so, $a x_1, a x_2, a x_3$. So, it will be all three components will be equal. So, all the properties hold for this particular example also.

(Refer Slide Time: 13:56)

$$\begin{aligned} S &= \{(x_1, x_2, x_3) \in \mathbb{R}^3 \mid x_1 + x_2 + x_3 = 1\} \\ \Rightarrow (0, 0, 0) &\Rightarrow 0 + 0 + 0 \neq 1 \\ \Rightarrow (0, 0, 0) &\notin S \\ \Rightarrow S &\text{ is NOT a subspace of } \mathbb{R}^3. \end{aligned}$$

Now, come to the last one x_1, x_2, x_3 belongs to \mathbb{R}^3 $x_1 + x_2 + x_3 = 1$ is not a subspace of \mathbb{R}^3 . So, what I am saying? I am taking a set S x_1, x_2, x_3 belongs to \mathbb{R}^3 such that, $x_1 + x_2 + x_3 = 1$. So, what I am having from here and so, if I take zero vector, then $0 + 0 + 0$ is not equals to 1. What it is saying that the zero vector of \mathbb{R}^3 is not in S and hence, S is not a subspace of \mathbb{R}^3 .

(Refer Slide Time: 14:57)

Further, if we have a subspace of \mathbb{R}^3 , then what are the possibilities? Either it will be origin, or it will be a line passing through origin or it will be a plane passing through origin. So, here I am telling you the geometrical interpretation of a subspace of \mathbb{R}^3 . So, if you are having a subspace of \mathbb{R}^3 , either it will be origin that is $0, 0, 0$ because that will be a trivial subspace of \mathbb{R}^3 or a line passing through origin or a plane passing through origin or the space \mathbb{R}^3 itself.

So, first and last are trivial subspaces, while the middle two are nontrivial subspaces. So, only these four possibilities we are having geometrically for subspaces of \mathbb{R}^3 .

(Refer Slide Time: 16:46)

Results on subspaces
Theorem: The intersection of any non-empty collection of subspaces of \mathbb{R}^n is a subspace of \mathbb{R}^n .

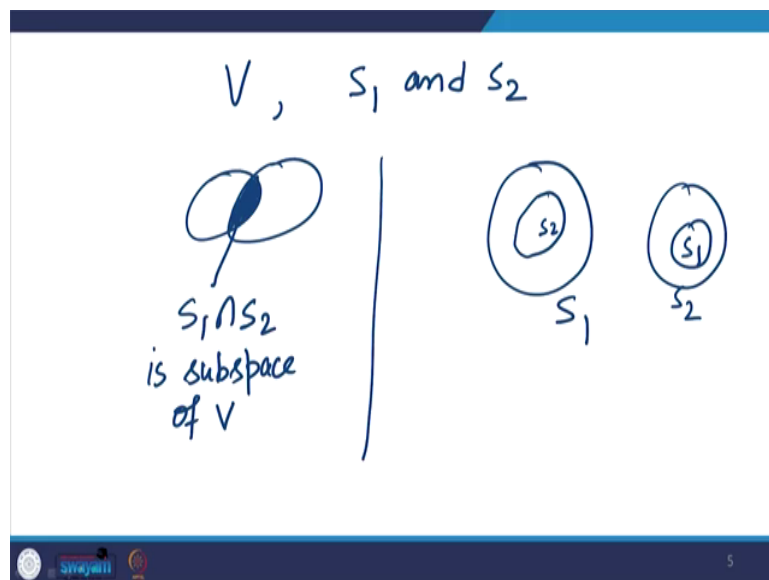

Results on subspaces
Theorem: The union of two subspaces of \mathbb{R}^n is a subspace of \mathbb{R}^n iff one of them is contained in the other.

ET ROOKIEE NPTEL ONLINE CERTIFICATION COURSE 5

We are having some of the important results on the subspaces. One of the important result is the intersection of any non-empty collection of subspaces of \mathbb{R}^n is a subspace of \mathbb{R}^n or in simple language I can say, if you are having two subspaces of a vector space V , then their intersection will again be a subspace.

In case of union, what we can say? In general, the union of two subspaces of a vector space may not be a subspace. When it will be subspace then one of them is contained in other.

(Refer Slide Time: 17:38)

So, what I want to say if you are having let us say a vector space V and you are having two subspaces S_1 and S_2 . So, if you take the intersection so, this is intersection. So, if S_1, S_2 are subspaces of V , then this sub intersection will be always a subspace of V .

But, we are talking about union so, if you are having a vector space sorry subspace S_1 and another vector subspace S_2 , then their union may not be a subspace, but it will be a subspace certainly when one is contained in other, either this case or if this is S_2 and this is S_1 . So, either S_2 is contained in S_1 or S_1 is contained in S_2 .

(Refer Slide Time: 18:51)

$$\begin{aligned} S_1 &= \{(x_1, x_2, x_3) \in \mathbb{R}^3 \mid x_1 + x_2 - x_3 = 0\} \\ S_2 &= \{(x_1, x_2, x_3) \in \mathbb{R}^3 \mid x_1 = x_2 = x_3\} \\ S_1 \cap S_2 &= \{(0, 0, 0)\} \end{aligned}$$

$x_1 + x_2 = x_3$
 $x_1 + x_2 = x_2$
 $\Rightarrow x_1 = 0$

How to see the intersection of subspaces? I have given two examples after the definition of subspaces one was we are having x_1, x_2, x_3 belongs to \mathbb{R}^3 $x_1 + x_2 - x_3 = 0$ so and we have shown that S_1 is a subspace of \mathbb{R}^3 . Another example I have given that time that x_1, x_2, x_3 belongs to \mathbb{R}^3 such that, $x_1 = x_2 = x_3$. So, again this S_2 is also a subspace of \mathbb{R}^3 .

What kind of element we will be having in S_2 ? $1, 1, 1, 2, 2, 2, 0, 0, 0$ where all the three components are equal and what kind of element we will be having in S_1 where the sum of first two components equals to third component. For example, $1, 1, 2, 3, 4, 7$ like this so, $3 + 4$ equals to the third component $7, 0, 0, 0$.

What is the intersection of S_1 and S_2 ? So, here intersection will be only the zero vector. Because this vector is satisfying both of these properties. No other vector in \mathbb{R}^3 will satisfy

this particular property because this property saying that all the three components are equal and this is saying the sum of first two component equals to the third one. So, what we are saying from the first one, $x_1 + x_2 = x_3$ and from the second one, $x_1 = x_2$ equals to x_3 .

So, if I write $x_1 + x_2$ so, from the second one, $x_3 = x_2$ so, equals to x_2 . So, from here what I will get $x_1 = 0$ and if x_1 is 0 so, x_2 and x_3 . So, only this vector will be in their intersection and it is a trivial subspace of \mathbb{R}^3 .

(Refer Slide Time: 21:31)

Linear Span

Definition: Let $V(F)$ be a vector space.
 Let $S = \{v_1, v_2, \dots, v_n\}$ be a non-empty subset of V . Then the set
 $L(S) = \{c_1 v_1 + c_2 v_2 + \dots + c_n v_n \mid c_i \in \mathbb{R}, 1 \leq i \leq n\}$ is a linear span of the set S .

Example

- 1) $\mathbb{R}^2 = L(\{(1,0), (0,1)\})$
- 2) $\mathbb{R}^3 = L(\{(1,0,0), (0,1,0), (0,0,1)\})$
- 3) If S is empty set, then $L(S) = \{\vec{0}\}$
- 4) Let $S = \{(1,1,1), (2,1,3)\} \subseteq \mathbb{R}^3$ and $F = \mathbb{R}$. Then
 $L(S) = \{c_1(1,1,1) + c_2(2,1,3) \mid c_1, c_2 \in \mathbb{R}\}$
 $= \{c_1 + 2c_2, c_1 + c_2, c_1 + 3c_2 \mid c_1, c_2 \in \mathbb{R}\}$
 $= \{(x_1, x_2, x_3) \in \mathbb{R}^3 \mid 2x_1 - x_2 = x_3\}$

NPTEL ONLINE
 CERTIFICATION COURSE

6

Now, we are coming another important definition that is linear span. So, let $V(F)$ be a vector space. Let $S = \{v_1, v_2, \dots, v_n\}$ be a non-empty subset of V . So, S is a set of vectors where vectors are coming from V . Then the set $L(S)$ defined by $c_1 v_1 + c_2 v_2 + \dots + c_n v_n$ that is the

linear combination of vectors v_1, v_2, v_n where all these coefficient c_1, c_2, c_n are coming from set of real numbers is a linear span of the set S .

(Refer Slide Time: 22:16)

$$\begin{aligned}
 S &= \{(1,0), (0,1)\} & S \subseteq \mathbb{R}^2 \\
 L(S) &= c_1(1,0) + c_2(0,1), \quad c_1, c_2 \in \mathbb{R} \\
 &= (c_1, c_2) \\
 L(S) &= \{(c_1, c_2) \mid c_1, c_2 \in \mathbb{R}\} = \mathbb{R}^2 \\
 S &= \{(1,0,0), (0,1,0), (0,0,1)\} \\
 L(S) &= \{(c_1, c_2, c_3) \mid c_1, c_2, c_3 \in \mathbb{R}\} \\
 &= \mathbb{R}^3.
 \end{aligned}$$

So, for example, if I take S equals to $1, 0$ and $0, 1$. So, S is a subset of \mathbb{R}^2 we are having two vectors from \mathbb{R}^2 . Now, $L(S)$ will be $c_1(1, 0)$ plus $c_2(0, 1)$ where c_1, c_2 belongs to \mathbb{R} . So, what this will become? c_1, c_2 . So, what is $L(S)$? $L(S)$ is (c_1, c_2) where c_1, c_2 belongs to \mathbb{R} and what is this? This is nothing just the space \mathbb{R}^2 .

So, here linear span of $1, 0$ and $0, 1$ is \mathbb{R}^2 . Similarly, if I take three vectors $1, 0, 0, 0, 1, 0, 0, 0, 1$ then linear span of S will become like the earlier one c_1, c_2, c_3 such that c_1, c_2, c_3 belongs to \mathbb{R} and what is this? This is \mathbb{R}^3 .

(Refer Slide Time: 24:09)

Example

$$S = \{(1, 2, 0), (1, 1, -1)\}$$
$$L(S) = \{c_1(1, 2, 0) + c_2(1, 1, -1)\}$$
$$= \{(c_1 + c_2, 2c_1 + c_2, -c_2)\}$$

If I take any arbitrary example, in \mathbb{R}^3 let us say I am having a set 1, 2, 0, 1, 1, minus 1 then linear span of S is c_1 times 1, 2, 0 plus c_2 times 1, 1, minus 1. So, what is this? I am having $c_1 + c_2$, $2c_1 + c_2$, minus c_2 . So, this is the linear span of this set.

(Refer Slide Time: 25:11)

$$\begin{aligned}
 \underline{\text{Ex:}} \quad S &= \{(1, 1, 1), (2, 1, 3)\} \\
 L(S) &= \left\{ c_1(1, 1, 1) + c_2(2, 1, 3) \mid c_1, c_2 \in \mathbb{R} \right\} \\
 &= \left\{ (c_1 + 2c_2, c_1 + c_2, c_1 + 3c_2) \mid c_1, c_2 \in \mathbb{R} \right\} \\
 &= \left\{ (x_1, x_2, x_3) \mid 2x_1 - x_3 = x_2 \right\} \\
 &\quad \quad \quad 2c_1 + 4c_2 - c_1 - 3c_2 = c_1 + c_2 = x_2 \\
 &\quad \quad \quad \searrow \underline{\mathbb{R}^3}
 \end{aligned}$$

Another example I can take this one. S equals to $(1, 1, 1)$ and $(2, 1, 3)$. So, what will be linear span of S ? So, again I will take $c_1(1, 1, 1)$ plus $c_2(2, 1, 3)$ and c_1, c_2 belongs to \mathbb{R} .

So, this will be c_1 plus $2c_2$, c_1 plus c_2 and c_1 plus $3c_2$ and c_1, c_2 belongs to \mathbb{R} . So, what is this? How I can represent this set? I can represent this set as x_1, x_2, x_3 such that, twice of x_1 minus x_3 equals to x_2 because if you take 2 times of this so, 2 times of this will become $2c_1$ plus $4c_2$ minus x_3 so, minus c_1 minus $3c_2$ it will come out to be c_1 plus c_2 and which is x_2 only. So, this is the linear span of S and we will say that it will be a you can easily prove that it will be a subspace of \mathbb{R}^3 .

(Refer Slide Time: 27:12)

Important Results

Theorem: Let $V(F)$ is a vector space and let S be a non-empty subset of V . Then $L(S)$ is a subspace of V .

Proof:

Important Results

Theorem: Let S be a non-empty subset of a vector space V . Then $L(S)$ is the smallest subspace of $V(F)$ containing S .

Proof:

NPTEL ONLINE
CERTIFICATION COURSE

So, we are coming to these results only that let V is a vector space and let S be a non-empty subset of V . Then the linear span of S is a subspace of vector space V . Moreover, this subspace is the smallest subspace containing S . What I want to say? If V is a vector space, S is a subspace of V , then the linear span of S is the smallest subspace containing the subspace S . So, I am leaving the proof of these two results as an exercise.

(Refer Slide Time: 28:03)

Some important subspaces

Let

$$A_{m,n} = \begin{pmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1} & a_{m2} & \cdots & a_{mn} \end{pmatrix}$$

where $a_{ij} \in \mathbb{R}$. Then

1) The row space of A is given by $L(\{(a_{11}, a_{12}, \dots, a_{1n}), (a_{21}, a_{22}, \dots, a_{2n}), \dots, (a_{m1}, a_{m2}, \dots, a_{mn})\})$ is a subspace of $\mathbb{R}^n(\mathbb{R})$.

ET ROORKEE NPTEL ONLINE CERTIFICATION COURSE 8

Now we are going to define some of the important subspaces. So, if we are having a m by n matrix given by the entries $a_{11}, a_{12}, a_{1n}, a_{21}, a_{22}, a_{2n}$ like that where a_{ij} are real number so, all these entries are coming from the set of real numbers, then the row space of A is given by the linear span of the rows where each row is a vector.

(Refer Slide Time: 28:27)

Continued...

2) The column space of A is given by
 $L(\{(a_{11}, a_{21}, \dots, a_{m1}), (a_{12}, a_{22}, \dots, a_{m2}), \dots, (a_{1n}, a_{2n}, \dots, a_{mn})\})$ is a subspace of $\mathbb{R}^m(\mathbb{R})$.

3) The set $N(A) = \{x \in \mathbb{R}^n \mid AX = 0\}$ is said to be nullspace of A .

4) The set $R(A) = \{b \in \mathbb{R}^m \mid AX = b \text{ for some } X \in \mathbb{R}^n\}$ is said to be range of A .

In general, $\text{column space}(A) = R(A)$

IT ROOKIE NPTEL ONLINE CERTIFICATION COURSE 9

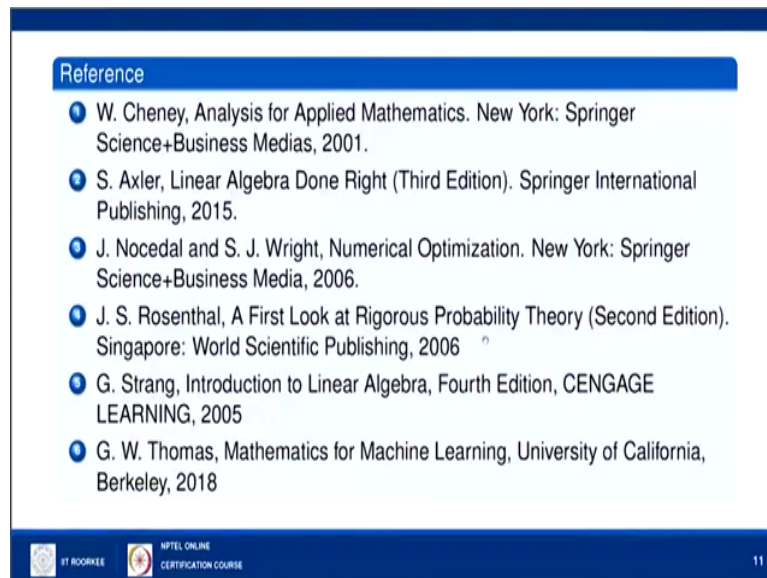

Similarly, the column space of A is given by the columns of the matrix A . Linear span of the column of the matrix of A . Then, we are having null space of A . So, nullspace of A is x belongs to \mathbb{R}^n such that AX equals to 0 . So, all n dimensional vectors from \mathbb{R}^n if you multiply those vector with A like A into x , you get the zero vector. So, all those the space of all those vectors x from \mathbb{R}^n is called nullspace of A and it is a subspace of \mathbb{R}^n .

The set sorry it should be R here $R(A)$ not null space A . So, the set $R(A)$ is all those m dimensional vector b such that AX equals to b for some X belongs to \mathbb{R}^n and it is called range space of A .

In general, column space of A equals to range space of A . So, we are saying these are the four important subspaces related to a matrix and we frequently used these subspaces in machine

learning especially for dimensional reduction concepts like principle component analysis and all kernel based dimensional reduction algorithms. So, one should know all these four subspaces.

IIT ROORKEE NPTEL ONLINE CERTIFICATION COURSE 11

So, in this lecture, we have learn about vector subspaces. We start with a definition, then we have given an alternate definition, then we have given some of the example of subspaces, we have seen four important subspaces related to a matrix, we have seen some of the important result like the union of subspaces, intersection of subspaces and then, linear span of a subset of a vector space which is again a subspace. We have seen several examples. So, these are the references for this lecture. I hope you have enjoyed this lecture.

Thank you very much.
