Tensors and Differential Forms 2

(Refer Slide Time: 00:54)

Welcome to the 46th lecture in our series. So, last time I had started discussion, started discussing multilinear maps on vector spaces and I had introduced the operation of tensor product of 2 multilinear maps. Now, using the tensor product operation, I want to get a nice basis for this. I start with some finite dimensional vector spaces V_1 up to V_k . And I look at multi linear maps of V_1 cross the Cartesian product of these V_i 's, which we have denoted by this L , L of V_1, V_2, V_k all the way up to, ya, and to the target being \mathbb{R} .

Now, the building blocks for this basis will be these 1 forms. In other words, the basis of 1 forms, namely the dual basis of dual basis. So, of course, when I say dual basis, what I am already assuming that, I start with a basis for v_i then get a dual basis for v_i step. So let us, I stopped at this point.

The claim is then, as we have seen before, if I take the tensor product of all these 1 forms, I get an element of L V_1, V_2, V_k . So, the claim is that all those tensor products will give me a basis. So, I look at the collection of all ω_{i_1} for each of this. So, this i_1 is just keeping track of which vector space I am at and then within that, there is a whole bunch of possibilities. So, let me use j_1 to denote that tensor ω_{i_k} and then j_k .

This can be a bit confusing but it becomes clear if we explicitly mention the range of these indices. For instance, this i_1 here all the i, i_1 up to i_k , this set is essentially keeping track of, this is just a, 1 all the way

up to k . It is just a permutation of this 1 up to k . So, nothing much going on here. As for this, now there is more freedom in this superscript. And this j, j_1 for instance will vary from 1 to n_1 , no, sorry, the vector space here is V_1 , so n_1 , j, j_1 will vary from 1 to n_1 .

(Refer Slide Time: 04:18)

Ex: $K=2$. $\{u_1^1, \dots, u_{n_1}^1\}$ basis for V_1
 $\{u_1^2, \dots, u_{n_2}^2\}$ basis for V_2

$\{\omega_1^1, \dots, \omega_{n_1}^1\}$ basis for V_1^*
 $\{\omega_1^2, \dots, \omega_{n_2}^2\}$ basis for V_2^*

$L(V_1, V_2; \mathbb{R})$
 $\{\omega_{i_1}^{j_1} \otimes \omega_{i_2}^{j_2}\} \quad \{i_1, i_2\} = \{1, 2\}$

Then $\{\omega_{i_1}^{j_1} \otimes \dots \otimes \omega_{i_k}^{j_k}\} \quad \{j_1, \dots, j_k\} = \{1, \dots, k\}$
 $1 \leq j_1 \leq n_{i_1}$
 $1 \leq j_k \leq n_{i_k}$

Ex: $K=2$. $\{u_1^1, \dots, u_{n_1}^1\}$ basis for V_1
 $\{u_1^2, \dots, u_{n_2}^2\}$ basis for V_2

$\{\omega_1^1, \dots, \omega_{n_1}^1\}$ basis for V_1^*
 $\{\omega_1^2, \dots, \omega_{n_2}^2\}$ basis for V_2^*

So, perhaps as an example, let us just deal with the simplest case. I have 2 vector spaces. K equals just 2 let us say. So, I start with the basis v with our notation v_1, \dots, v_{n_1} . So, this is a basis for V_1 . Then v_1, v_2, \dots, v_{n_2} into basis for V_2 . And then we get a dual basis. It is, the index comes below omega $\omega_{i_1}^{j_1}, \dots, \omega_{i_k}^{j_k}$, basis for V_1^* . $\omega_{i_2}^{j_2}, \dots, \omega_{i_k}^{j_k}$ basis for V_2^* .

And then, what we are, ya, now what we are claiming is that one wants, so one wants a basis for $L(V_1, V_2; \mathbb{R})$. So, what I claim is that, look at all the collection of all tensor products of every element in this first set here with every element in the second set. So, in other words one look at ω , so just to be consistent, so I have used i and j . So i , so i , let us use the same notation. i_1, j_1 tensor ω_{i_2, j_2} . So, this and i_1, i_2, i_1 comma i_2 , this is just a permutation of 1 comma 2 . Actually, right. So here one has to be, in the case of different vector spaces, one has to be slightly careful. Notice that when I have 2 different vector spaces, you have to be bit more cautious here.

(Refer Slide Time: 07:47)

The image consists of two screenshots of a Windows Journal window, showing handwritten mathematical notes.

Top Screenshot:

- At the top right, there is a definition: $1 \leq i_1 \leq n_1$ and $1 \leq i_2 \leq n_2$.
- On the left side, it says: $\omega_1 \in V_1^*$, $\omega_2 \in V_2^*$, and $\omega_1 \otimes \omega_2 \in L(V_1, V_2; \mathbb{R})$. Below this, $\omega_2 \otimes \omega_1$ is circled.
- In the center, it says "ex: $K=2$ ".
- On the right side, it lists:
 - $\{U_1^1, \dots, U_{n_1}^1\}$ basis for V_1
 - $\{U_1^2, \dots, U_{n_2}^2\}$ basis for V_2
 - $\{\omega_1^1, \dots, \omega_{n_1}^1\}$ basis for V_1^*
 - $\{\omega_1^2, \dots, \omega_{n_2}^2\}$ basis for V_2^*
- At the bottom, it says $L(V_1, V_2; \mathbb{R})$.

Bottom Screenshot:

- At the top, it says "let $\dim V_i = n_i$, and let $\{U_1^i, \dots, U_{n_i}^i\}$ be a basis for V_i , $i=1, \dots, k$."
- Below that, it says "let $\{\omega_1^i, \dots, \omega_{n_i}^i\}$ be the dual basis for V_i^* ."
- Then, it says "Then $\{\omega_1^{i_1} \otimes \dots \otimes \omega_k^{i_k}\}$ ".
- At the bottom right, it repeats the definition: $1 \leq i_1 \leq n_1$ and $1 \leq i_k \leq n_k$.
- At the bottom left, it repeats: $\omega_1 \in V_1^*$, $\omega_2 \in V_2^*$.
- In the center, it repeats "ex: $K=2$ ".
- On the right side, it repeats:
 - $\{U_1^1, \dots, U_{n_1}^1\}$ basis for V_1
 - $\{U_1^2, \dots, U_{n_2}^2\}$ basis for V_2

Then $\{\omega_1^{j_1} \otimes \dots \otimes \omega_k^{j_k}\}$

$$1 \leq j_1 \leq n_{j_1}$$

$$1 \leq j_k \leq n_{j_k}$$

$\omega_1 \in V_1^*$
 $\omega_2 \in V_2^*$
 $\omega_1 \otimes \omega_2 \in L(V_1, V_2; \mathbb{R})$
 $\omega_2 \otimes \omega_1$

ex: $k=2$

$\{u_1^1, \dots, u_{n_1}^1\}$ basis for V_1
 $\{u_1^2, \dots, u_{n_2}^2\}$ basis for V_2
 $\{\omega_1^1, \dots, \omega_{n_1}^1\}$ basis for V_1^*
 $\{\omega_1^2, \dots, \omega_{n_2}^2\}$ basis for V_2^*

$1, \dots, V, \dots, \mathbb{R}$

So, when I have 2 different vector spaces and if I have, so with my notation ω_1 is an element of V_1^* , ω_2 is an element of V_2^* , then $\omega_1 \otimes \omega_2$ is an element of $L(V_1, V_2; \mathbb{R})$. But, right. So, this makes perfect sense the way I have defined it. However, if I look at $\omega_2 \otimes \omega_1$, this is not quite an element of $L(V_1, V_2; \mathbb{R})$. So, the reason being of course that, the way we defined it, $\omega_1 \otimes \omega_2$ is going to be a mapping from $V_1 \times V_2$.

So, the first variable necessarily is from V_1 . While if I write it like this, the first variable will have to be from V_2 . So, this is not inside this, in this space, this one is. Now if $V_1 = V_2$, then both of these will be inside this. It does not, both of them are well defined and both of them belong to that. So, here for instance when I write i_1 up to i_k , so, it is not, I have to be actually, I cannot even permute them in general. So, let me just erase this. So, I will necessarily have to deal with this stuff. So j_1 , the rest remains the same. So, when k equals 2, so, right. So, this is a basis for this and this is a basis for this.

(Refer Slide Time: 10:07)

$\omega_2 \otimes \omega_1$
 $\{\omega_1^1, \dots, \omega_1^{n_1}\}$ basis for V_1^*
 $L(V_1, V_2; \mathbb{R})$
 $\{\omega_1^{j_1} \otimes \omega_2^{j_2} \mid 1 \leq j_1 \leq n_1, 1 \leq j_2 \leq n_2\}$
 is a basis for $L(V_1, V_2; \mathbb{R})$

So here too, I have to make a small change. So, this is, I just, in fact it is simpler. It is $\omega_1 \omega_2$. And then I no longer have to mention this. So j_1 is going to vary from 1 to n_1 , j_2 is vary, going to vary from 1 to n_2 . The collection of all these tensor products is a basis, this is the claim basis for $L(V_1, V_2; \mathbb{R})$. And notice that if we count how many elements there are, well j_1 can vary from 1 to n_1 and j_2 can vary from 1 to n_2 . So, there are exactly $n_1 n_2$ elements here. And that is going to be, in the general setup also that is going to be the case.

(Refer Slide Time: 11:20)

Then $\{\omega_1^1 \otimes \dots \otimes \omega_k^{n_k}\}$ $\dim(V_1, \dots, V_k; \mathbb{R}) = n_1 \dots n_k$
 $1 \leq j_1 \leq n_1$
 $1 \leq j_k \leq n_k$
 $\omega_1 \in V_1^*$
 $\omega_2 \in V_2^*$
 $\omega_1 \otimes \omega_2 \in L(V_1, V_2; \mathbb{R})$
 $\omega_2 \otimes \omega_1$
 ex: $k=2$ $\{u_1^1, \dots, u_{n_1}^1\}$ basis for V_1
 $\{u_1^2, \dots, u_{n_2}^2\}$ basis for V_2
 $\{\omega_1^1, \dots, \omega_1^{n_1}\}$ basis for V_1^*
 $\{\omega_2^1, \dots, \omega_2^{n_2}\}$ basis for V_2^*
 $L(V_1, V_2; \mathbb{R})$

So, let me mention in particular, dimension of $V_1, V_k; \mathbb{R}$ is n_1 the product of all the dimensions of the underlying vector spaces.

(Refer Slide Time: 11:47)

The image consists of two screenshots of a digital whiteboard, likely from a video lecture. The top screenshot shows the following handwritten text:

is a basis for $L(V_1, V_2, \dots, V_k)$

Proof: B spans $L(V_1, \dots, V_k; \mathbb{R})$
 i.e. given $F \in L(V_1, \dots, V_k; \mathbb{R})$
 we can find $F_{j_1 \dots j_k} \in \mathbb{R}$ such that

$$F = \sum F_{j_1 \dots j_k} \omega_1^{j_1} \otimes \dots \otimes \omega_k^{j_k}$$

The bottom screenshot shows the same text as the top one, but with an additional equation labeled $(*)$:

$$(*) \quad F = \sum F_{j_1 \dots j_k} \underbrace{\omega_1^{j_1} \otimes \dots \otimes \omega_k^{j_k}}_{(*)}$$

Below this, it says:

Let $F_{j_1 \dots j_k} = F(v_1^{j_1}, \dots, v_k^{j_k})$.

Then $(*)$ holds: let $(v_1, \dots, v_k) \in V_1 \times \dots \times V_k$

then $(\omega_1^{j_1} \otimes \dots \otimes \omega_k^{j_k})(v_1, \dots, v_k)$

$$= \omega_1^{j_1}(v_1) \dots \omega_k^{j_k}(v_k)$$

So, let us prove this. The proof is simple enough. So, proof. So, we want to show that these elements, these multilinear forms, multilinear maps actually form a span this $L(V_1, V_2, \dots, V_k)$ and they are linearly independent. So, let us just check that they span. So, in other words, any multilinear map can be expressed as a linear combination of the special one multilinear maps. So, let us check that. So, let us give it a name actually, this set, the what we want to be the basis, so let B , let us call this so set B . B spans $L(V_1, \dots, V_k, \mathbb{R})$, that is the first thing. And i.e. given F in $L(V_1, \dots, V_k, \mathbb{R})$, we can find F . Now j_1 up to j_k . $F_{j_1 \dots j_k}$ dot, dot, dot j_k in \mathbb{R} such that, of course, as usual, it is not a single number, so this j_i is vary from 1 to n_i .

So, we can find all these numbers such that F can be written as a linear combination $F_{j_1 \dots j_k}$ and then this basis elements, which I had here $\omega_{i_1} \dots \omega_{i_k}$ to the power $\omega_{i_1} \dots \omega_{i_k}$ etc. $\omega_{i_1} \dots \omega_{i_k}$ tensor $\omega_{j_1} \dots \omega_{j_k}$. So, this is the claim that we can.

So, in fact, so we have to come up with these constants, $F_{j_1 \dots j_k}$, for all possible values of $j_1 \dots j_k$. And it is clear how to find these coefficients. The idea is very simple. You just evaluate F on basis vectors, then these special forms, multi linear maps will all be 0 except the ones with the right index.

So, in fact, let us take, let $F_{j_1 \dots j_k}$ be equal to F of $v_{j_1} \dots v_{j_k}$, oh, I have to be again careful with whether I use a superscript when I go between 1 forms and vectors, the superscript changes.

So, for this it is, ya, okay. $v_{j_1} \dots v_{j_k}$, right $v_{j_1} \dots v_{j_k}$. So, these are the, some basis vectors that we started with. So, I evaluate the given multilinear map on certain basis vectors and I get a number. I call that as $F_{j_1 \dots j_k}$ and this $j_1 \dots j_k$ keeps track of which basis vector I am plugging in here. The same index which is occurring here.

So, let us take these coefficients with, the claim is that, with the choice of these coefficients, then this equation, then star holds. Well, when we say star holds, remember that both sides are multi linear maps. So, we have an equation of 2 multi linear maps. In other words, if I plug in, any K , if, if I evaluate the multilinear map on any K vectors, I should get the same thing.

So, let us see that we do get the same thing. So, let $v_1 \dots v_k$ the domain of this map F is $V_1 \dots V_k$, belong to $V_1 \times \dots \times V_k$. Then, here on the right side, I have a linear combination of multilinear maps. So, let us evaluate each term separately. In particular let us just evaluate and this is just this F , I, F is just a constant here. I evaluate this tensor product. Then $\omega_{i_1} \dots \omega_{i_k}$ tensor $\omega_{j_1} \dots \omega_{j_k}$ acting on even v_k equals this entire thing acting on this equals, so well by definition of tensor product, this is $\omega_{i_1} \dots \omega_{i_k} v_1 \dots v_k$.

(Refer Slide Time: 18:34)

Let $F_{j_1 \dots j_k} = F(u_{j_1}^1, \dots, u_{j_k}^k)$

then (*) holds: let $(x_1, \dots, x_k) \in V_1 \times \dots \times V_k$

then $(\omega_{j_1}^{i_1} \otimes \dots \otimes \omega_{j_k}^{i_k})(x_1, \dots, x_k)$

$$= \omega_{j_1}^{i_1}(x_1) \dots \omega_{j_k}^{i_k}(x_k)$$

$$= x_1^{i_1} \dots x_k^{i_k}$$

we can write

$$x_1 = \sum_{i_1=1}^{n_1} x_1^{i_1} u_{i_1}^1$$

$$\vdots$$

$$x_k = \sum_{i_k=1}^{n_k} x_k^{i_k} u_{i_k}^k$$

then $\omega_{j_1}^{i_1}(x_1) = \sum_{i_1=1}^{n_1} x_1^{i_1} \omega_{j_1}^{i_1}(u_{i_1}^1)$

$= 0$ if $j_1 \neq i_1$
 $= 1$ if $j_1 = i_1$

then $\omega_{j_1}^{i_1}(x_1) = \sum_{i_1=1}^{n_1} x_1^{i_1} \omega_{j_1}^{i_1}(u_{i_1}^1)$

$= 1$ if $j_1 = i_1$
 $= 0$ if $j_1 \neq i_1$

L.H.S. $= x_1^{j_1}$

$= F(x_1, \dots, x_k)$

R.H.S. of (*)

$$= \sum_{j_1 \dots j_k} F_{j_1 \dots j_k} x_1^{j_1} \dots x_k^{j_k}$$

$$= \sum F(u_{j_1}^1 \dots u_{j_k}^k) x_1^{j_1} \dots x_k^{j_k}$$

L.H.S. = R.H.S. by multilinearity of F.

($F(x_1, \dots, x_k) = F(\sum_i x_1^i u_{i_1}^1, x_2, \dots, x_k)$)

$$= \sum_i x_1^i F(u_{i_1}^1, x_2, \dots, x_k)$$

i.e. given $F \in L(V_1, \dots, V_k; \mathbb{R})$
 we can find $F_{i_1 \dots i_k} \in \mathbb{R}$ such that
 (*)
$$F = \sum F_{i_1 \dots i_k} \underbrace{\omega_1^{i_1} \otimes \dots \otimes \omega_k^{i_k}}$$

Let $F_{i_1 \dots i_k} = F(v_1^{i_1}, \dots, v_k^{i_k})$.
 Then (*) holds: let $(x_1, \dots, x_k) \in V_1 \times \dots \times V_k$
 then $(\omega_1^{i_1} \otimes \dots \otimes \omega_k^{i_k})(x_1, \dots, x_k)$

$$= \omega_1^{i_1}(x_1) \dots \omega_k^{i_k}(x_k)$$

$$= x_1^{i_1} \dots x_k^{i_k}$$

 we can write

$$x = \sum_{i=1}^n x_i v_i$$

L.H.S. = R.H.S. by multilinearity of F .
 (*)
$$F(x_1, \dots, x_k) = F(\sum_i x_1^i v_1^i, x_2, \dots, x_k)$$

$$= \sum_i x_1^i F(v_1^i, x_2, \dots, x_k)$$

 etc.

Now, we can simplify this further. So, v_i , after all, each of these vector, these are arbitrary vectors in this vector spaces. So v_1 itself and I already have basis for all of these vector spaces, so let us write v_1 as, in terms of the basis vectors. Perhaps it is better instead of, if v has already been used, let us use x . Let x_1 , that will also make it clear that these are variables. And so $x_1 \dots x_k$ and then $x_1 \dots x_k$. And so, let us express this x_i in terms of, we can write x_1 equals summation $x_1^{i_1} v_1^{i_1}$. So i_1 equals is a index running from 1 to n_1 . Similarly, all the way up to x_k . x_k equals i_k running from 1 to n_k . I put a k here i_k $v_k^{i_k}$ and then k here.

Once I do that, then $\omega_1^{j_1}$, so now I want to look at this. $\omega_1^{j_1} x_1$ will be i_1 equal to 1 to n_1 $x_1^{i_1} \omega_1^{j_1}$ acting on $v_1^{i_1}$. Now, by the very definition of a dual basis, the only way, if j_1 is not equal to i_1 , I get this term here is equal to 0 if j_1 not equal to i_1 equal to 1 if j_1 equal to i_1 . So, when it is 1, so

the only term which will survive is i_1 equals j_1 . And when i_1 equals j_1 , I just get this coefficient. So, this is $x_1 j_1$. Right. So, and the same thing happens for all of them. So, finally this thing here can be written as $x_1 j_1 x_k j_k$.

And therefore, remember that we were in the process of evaluating, so we wanted to check that this equation holds. So, we evaluated both sides on this k (())(22:01) of vectors x_1 up to x_k . On the left-hand side, I get, so this is not, therefore LHS of the equation star is F of x_1 up to x_k . RHS of star is, that is what all these simplifications show, RHS of star is summation of this, well, summation of $F j_1 j_k$, $F j_1$ all the way to j_k and then $x_1 j_1$, $x_k j_k$. So, we have to show that this LHS this equal to this.

But we have not used the definition of $F j_1 j_k$. This is F evaluated on, this is the definition. So, what we have here, is the definition of $F j_1 j_k$, $v_1 j_1$, $v_k j_k$, $v_1 j_1$, $v_k j_k$ this times $F j_1 x_k j_k$. So, we have to show that this quantity here is the same as this and that follows immediately from multi linearity. So, by multi linearity of F . In other words, I will just write, so, for example, the first step in proving this would be, I just, instead of x_1 , I use the, I will not do the, complete the whole calculation. Let me just indicate how it goes. $F x_1$ all the way up to x_k . Instead of x_1 , I plug in the expansion of x_1 in terms of the basis as I have defined it here $x_{i_1} v_{i_1}$ and the other stuff I keep as they are, then I get a summation over i_1 and then x this i_1 . Then F of v_{i_1} , x_2 , x_k . in the next step, so this is a summation if over the index i_1 .

For each i_1 , I can, instead of x_2 , I can plug in the expansion of x_2 and again expand. So finally, I will get a sum which involves only these terms that I have here. And these coefficients come out as they are, as expected. So, I will just write etc. So that completes the statement that these special one, special tensor, multilinear maps obtained by tensor product of 1 forms actually span the full space of multilinear forms.

(Refer Slide Time: 25:54)

et

B is linearly independent:

$$\sum F_{j_1 \dots j_k} (\omega_{j_1}^{i_1} \otimes \dots \otimes \omega_{j_k}^{i_k}) = 0$$

Evaluating this at $(v_{i_1}^1, \dots, v_{i_k}^k)$ ↙

we see that $F_{i_1, \dots, i_k} = 0$

$$\left[\underbrace{\omega_{i_1}^{j_1} \otimes \dots \otimes \omega_{i_k}^{j_k}}_{= 0} \left(\underbrace{\psi_{i_1}^{j_1} \dots \psi_{i_k}^{j_k}}_{(j_1, \dots, j_k) \neq (i_1, \dots, i_k)} \right) \right. \\ \left. \underbrace{\omega_{i_1}^{j_1} \psi_{i_1}^{j_1} \dots \omega_{i_k}^{j_k} \psi_{i_k}^{j_k}}_{= 1} \quad \text{if} \quad (j_1, \dots, j_k) = (i_1, \dots, i_k) \right]$$

i.e. given $F \in L(V_1, \dots, V_n; \mathbb{R})$
we can find $F_1, \dots, F_k \in \mathbb{R}$ such that

$$(*) \quad F = \sum_{j_1, \dots, j_k} F_{j_1, \dots, j_k} \underbrace{\omega_{j_1}^{i_1} \otimes \dots \otimes \omega_{j_k}^{i_k}}_{\text{---}}$$

Let $F_{j_1 \dots j_k} = F(v_{j_1}^1, \dots, v_{j_k}^k)!$

Then (*) holds: let $(x_1, \dots, x_k) \in V_1 \times \dots \times V_k$

$$\begin{aligned} \text{Then } & (\omega_1^{j_1} \otimes \dots \otimes \omega_k^{j_k})(x_1, \dots, x_k) \\ &= \omega_1^{j_1}(x_1) \dots \omega_k^{j_k}(x_k) \\ &= x_1^{j_1} \dots x_k^{j_k} \end{aligned}$$

we can write n .

we see that $F_{i_1, \dots, i_k} = 0$

$$\left[\omega_{i_1}^{j_1} \otimes \dots \otimes \omega_{i_k}^{j_k} \right] (v_{i_1}^{j_1}, \dots, v_{i_k}^{j_k})$$

$$\omega_{i_1}^{j_1}(v_{i_1}^{j_1}) \dots \omega_{i_k}^{j_k}(v_{i_k}^{j_k}) = \begin{cases} 0 & \text{if } (j_1, \dots, j_k) \neq (i_1, \dots, i_k) \\ 1 & \text{if } (j_1, \dots, j_k) = (i_1, \dots, i_k) \end{cases}$$

Now, let us prove that this B is linearly independent. Again this, the same calculation can be used. So here, suppose some linear combination is 0. Suppose in linear combination, now the linear combination as I , right, so this the right-hand side. Let us again say, here we do not have a multilinear map. But I will just use the symbol capital F for the coefficients. I need some coefficients. I will use this capital F and $\omega_{i_1}^{j_1} \omega_{i_2}^{j_2} \dots \omega_{i_k}^{j_k}$ equal to 0. So, the fact that this is 0 means that it is a 0 as a multi linear map evaluating this at, so I just take a base, basis all the inputs are basis vectors just like I did here.

So, $i_1, v_1, i_1, v_k, v_k, i_k$, when I evaluate this the same calculation as earlier shows that this thing here evaluated on this evaluated on this will be 0 unless these indices i_1, i_2, i_k coincide with j_1, j_2, j_k . We see that and when they coincide, I just get 1. So, the only term which will survive in this big sum is when the index j_1, j_2, j_k is i_1, i_2, i_k , so that will give me this constant here $F_{i_1, i_2, \dots, i_k} = 0$ and this is true for all such i_1 up to i_k .

So, therefore all coefficients are 0. So, one sees that they are linearly independent as well. So just to be clear what we have used is F_{j_1, j_2, \dots, j_k} evaluated on $v_{i_1}, v_{i_2}, \dots, v_{i_k}$ equals 0 if this j_1, j_2, \dots, j_k is not equal to i_1, i_2, \dots, i_k . So even if one index here is different the whole product $(\omega_{i_1}^{j_1} \otimes \dots \otimes \omega_{i_k}^{j_k})(v_{i_1}, \dots, v_{i_k})$ otherwise it is 1 if j_1, j_2, \dots, j_k equal to i_1, i_2, \dots, i_k . It is immediate from the definition of the tensor product. After all, this number here is, we have already done that calculation, but let me just write it. $\omega_{i_1}^{j_1}(v_{i_1}) \dots \omega_{i_k}^{j_k}(v_{i_k})$ evaluated on $v_{i_1}, v_{i_2}, \dots, v_{i_k}$ and here it is a k .

So, this thing here is exactly equal to this. And here the moment one of these indices j_i is not equal to i_i , then this thing will be 0. The corresponding term will be 0. So, we get the required.

So, this is a good point to stop here. And in the next class we will talk about special kinds of multi linear maps and then move on to differential forms. Okay, thank you.
