(Refer Slide Time: 00:35)

Hello, and welcome to today's lecture. Let us continue with our discussion of the exterior differentiation operator, which acts on a differential  $p$  form and the output is a  $p$  plus 1 form. Well, the very existence of the such a operator, operator or linear map, linear differential map is a theorem and towards this we first do some preparatory work on open sets in  $\mathbb{R}^n$ . So, what we needed was this proposition, we have defined  $d$  and then we have defined the exterior differentiation map on differential forms on open sets in  $\mathbb{R}^n$ . And we want to check that these properties are satisfied. So, at the end of last class, I had finished proving one, the second property. Now let us move on to this crucial and somewhat mysterious third property,  $d$  compose with  $d$  is 0.

(Refer Slide Time: 01:48)

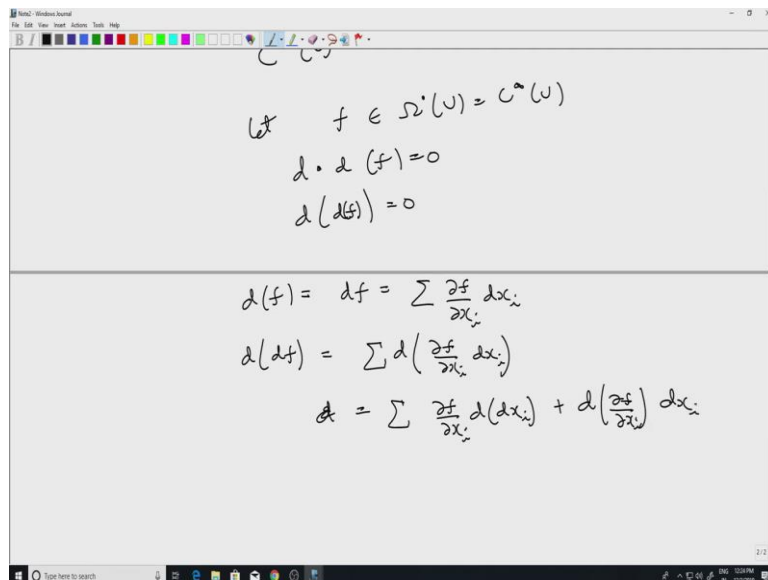

$$3) \quad d \circ d = 0.$$

$$\Omega^{k-1}(U) \xrightarrow{d} \Omega^k(U) \xrightarrow{d} \Omega^{k+1}(U)$$

$$\begin{array}{c} k=1 \\ \Omega^0(U) \xrightarrow{d} \Omega^1(U) \xrightarrow{d} \Omega^2(U) \\ \parallel \\ C^\infty(U) \end{array}$$

So, let me start with that. First, let us do it for 0 forms. So, remember that this  $d$  was supposed to be from  $\Omega^k U$  to  $\Omega^{k+1} U$  and here I have  $\Omega^{k-1} U$ . The claim was the  $d$  composition is 0. So, let us start with  $k$  equals 1. So, in which case I have and recall that we had defined this to be just  $C^\infty U$ , this to  $C^\infty$  functions on  $U$  and so, if I want to check the  $d$  compose.

(Refer Slide Time: 3:05)

$$\text{let } f \in \Omega^0(U) = C^\infty(U)$$

$$d \circ d(f) = 0$$

$$d(df) = 0$$

$$d(f) = df = \sum \frac{\partial f}{\partial x_i} dx_i$$

$$d(df) = \sum d\left(\frac{\partial f}{\partial x_i} dx_i\right)$$

$$d = \sum \frac{\partial f}{\partial x_i} d(dx_i) + d\left(\frac{\partial f}{\partial x_i}\right) dx_i$$

So, first what I have to do is let  $f$  belong to  $\Omega^0 U$  equal to  $C^\infty U$ , then I would like to check whether this is 0 or not. Well, the first, so, this is  $d$  of,  $d$  of  $f$ . Now  $df$  the way we have defined  $d$ , this was just our usual derivative operator on functions

and so, therefore, this is  $df$ , this is the same as  $\frac{\partial f}{\partial x_i} dx_i$ . So, when I take  $d$  of this, we have already proved the product rule in part two. So, using that, I can simplify this expression. So, first I take it inside the summation sign. And then note that  $d$ , so, this is equal to, I will get two terms, one is the  $\frac{\partial f}{\partial x_i} d(dx_i)$  plus  $d(\frac{\partial f}{\partial x_i}) \wedge dx_i$ .

(Refer Slide Time: 4:56)

The image shows a digital whiteboard with handwritten mathematical derivations. The equations are as follows:

$$d(f) = df = \sum \frac{\partial f}{\partial x_i} dx_i$$

$$d(df) = \sum d\left(\frac{\partial f}{\partial x_i} dx_i\right)$$

$$d = \sum \frac{\partial f}{\partial x_i} d(dx_i) + d\left(\frac{\partial f}{\partial x_i}\right) \wedge dx_i$$

Below this, it is noted that  $d(dx_i) = 0$ . A bracketed note explains this: "from the definition of  $d$ :  $d(\sum a_i dx_i) = \sum da_i \wedge dx_i$ ".

$$d(df) = \sum \left( \sum \frac{\partial^2 f}{\partial x_j \partial x_i} dx_j \right) \wedge dx_i$$

$$= \sum \frac{\partial^2 f}{\partial x_j \partial x_i} dx_j \wedge dx_i$$

Now, well,  $d$  of  $dx_i$ ,  $d$  of  $dx_i$  is 0. This is simply because the way we had defined  $d$ , what the way we had defined  $d$  was any form can be written as  $a_i dx_i$ . And we said that this is the same thing as  $da_i \wedge dx_i$ . which So, in other words, if these  $a_i$ 's are constants, then automatically  $d$  of that thing is 0. So, in particular  $d$  of  $dx_i$  is 0. So, therefore,  $d df$  equal to so, this term goes away. And I am left with and as for this, this term here, again, I use this expression, except that instead of  $f$  now I have  $\frac{\partial f}{\partial x_i}$  by  $\frac{\partial f}{\partial x_i}$ . So, I will have to use a different index when I take partial derivatives.

So, first, let us keep the, this sum is over  $i$ ,  $i$  and then this will be over  $j$ ,  $\frac{\partial f}{\partial x_j}$  of  $\frac{\partial f}{\partial x_i}$  then  $dx_j$ , wedge, Oh, here I should put a wedge. Wedge  $dx_i$  and now the term inside the brackets, I will combine these two sums, the sum of both indices vary from 1 to  $n$ . And this is just the mixed partial derivative  $\frac{\partial^2 f}{\partial x_j \partial x_i}$  by  $\frac{\partial f}{\partial x_i}$ ,  $dx_j \wedge dx_i$ . So, let us see why this is 0.

(Refer Slide Time: 7:48)

The image shows a handwritten derivation of the identity  $d(df) = 0$  in a presentation software window. The derivation proceeds as follows:

$$\begin{aligned}
 d(df) &= \sum_i \left( \sum_j \frac{\partial^2 f}{\partial x_j \partial x_i} dx_j \right) \wedge dx_i \\
 &= \sum_{i,j} \frac{\partial^2 f}{\partial x_j \partial x_i} dx_j \wedge dx_i \\
 &= \sum_{i < j} \left( \frac{\partial^2 f}{\partial x_j \partial x_i} dx_j \wedge dx_i \right) + \sum_{i > j} \left( \frac{\partial^2 f}{\partial x_j \partial x_i} dx_j \wedge dx_i \right) \\
 &= \sum_{i < j} \frac{\partial^2 f}{\partial x_j \partial x_i} dx_j \wedge dx_i + \sum_{j > i} \frac{\partial^2 f}{\partial x_i \partial x_j} dx_i \wedge dx_j \\
 &= \sum_{i < j} \frac{\partial^2 f}{\partial x_j \partial x_i} dx_j \wedge dx_i - \sum_{j > i} \frac{\partial^2 f}{\partial x_i \partial x_j} dx_j \wedge dx_i \\
 &= \sum_{i < j} \left( \frac{\partial^2 f}{\partial x_j \partial x_i} - \frac{\partial^2 f}{\partial x_i \partial x_j} \right) dx_j \wedge dx_i \\
 &= 0
 \end{aligned}$$

Well, when  $i$  equals  $j$ , I get  $dx_i$  wedge  $dx_i$ ,  $dx_i$  wedge  $dx_i$  that will be 0. So, we just have to consider two cases,  $i$  less than  $j$  of this expression plus  $i$  greater than  $j$  of this expression. So, it is the same thing here in both brackets. Now, what we do is let us just keep the first one as it is  $i$  less than  $j$   $\frac{\partial^2 f}{\partial x_j \partial x_i} dx_j \wedge dx_i$ . As for the second one, I will change, interchange  $i$  and  $j$ . So, it will become  $j$  greater than  $i$   $\frac{\partial^2 f}{\partial x_i \partial x_j} dx_i \wedge dx_j$ . I do that so, that basically, I want to yeah, let us, we will see. So,  $\frac{\partial^2 f}{\partial x_i \partial x_j} dx_i \wedge dx_j$  and here I get  $dx_i$  wedge  $dx_j$ . Now the point is that  $dx_i$  wedge  $dx_j$  is the same as so, the first term I keep as it is.

The second term,  $\frac{\partial^2 f}{\partial x_i \partial x_j} dx_i \wedge dx_j$  but I interchange I swap it, swap  $i$  and  $j$  again, I changed the order of exterior product rather. So, I get  $dx_j$  wedge  $dx_i$ , but I obtained in the process I get a minus sign. So, now, the summation, both the sums involve summing over  $i$  less than  $j$  here towards the second one is also now  $i$  less than  $j$ . So, I can write it as  $i$  less than  $j$   $\frac{\partial^2 f}{\partial x_j \partial x_i} dx_j \wedge dx_i$ , the second one is  $\frac{\partial^2 f}{\partial x_i \partial x_j} dx_j \wedge dx_i$ , which is 0, since the  $f$  is smooth, its mixed partial derivatives are the same. So, ultimately, the fact that  $d$  composed with  $d$  is 0 boiled on to just the equality of mixed partial derivatives for a smooth function, at least for (one form), 0 forms.

(Refer Slide Time: 10:32)

Handwritten notes on a digital whiteboard:

$$\text{Let } k \geq 1, \\ \omega \in \Omega^k(V). \\ \omega = \sum a_j dx_j$$

---

$$J = (j_1, \dots, j_k)$$

$$\alpha = da_j \\ d\alpha = d(da_j) = 0$$

$$d(\omega) = d\left(\sum_j da_j \wedge dx_j\right) \\ = d\left(\sum_j \underbrace{da_j}_{\alpha} \wedge \underbrace{dx_{j_1} \wedge \dots \wedge dx_{j_k}}_{\beta_j}\right) \\ = \sum_j \underbrace{d\alpha}_{=0} \wedge \beta_j - \alpha \wedge d\beta_j \\ = - \sum_j \alpha \wedge d\beta_j$$

Now, let us look at any form of any, so, let  $k$  be greater than or equal to 1 now. Let us start with  $\omega$   $k$  form. And I want to so, we can write  $\omega$  equals  $\sum a_j dx_j$  and this  $d\omega$  will be  $d$  of, so,  $d\omega$  is by definition  $da_j \wedge dx_j$ . And so, now, again, I plan to use, so, this sum is over multi indices  $j$ . So, let us, we, I plan to use this product rule, but for that let us recall that this is, I mean this is just  $dx_j$  is just shorthand notation for  $dx_{j_1} \wedge \dots \wedge dx_{j_k}$ . So, here as usual,  $J$  is the multi index,  $j_1, \dots, j_k$ . So, well, now I will just use this step two where which says that I can take this  $d$  of a product is because it obeys a sort of Leibnitz rule except that the second term acquires a negative sign depending on the degree.

Well, in this case, if you, one has to apply Leibnitz rule, so, there are  $k+1$  terms here. So, the first term will be, so, if I do this, let us this, let us regard this as a one form. Let us regard these two as  $\omega$   $\alpha$  and  $\beta_j$ , then I will get  $d\alpha \wedge \beta_j$  plus  $\alpha \wedge d\beta_j$ . So, if I call this  $\alpha$  and this is  $\beta_j$  rather. So, then I get  $d\alpha \wedge \beta_j$  plus, well, here I will be, now this  $\omega$  is, right.

So, here I will be getting a negative sign actually, because the first term here is a one form. Negative of then  $\alpha \wedge d\beta_j$ . Now  $\alpha$  is of the form  $da_j$ . So,  $d\alpha$  will be where  $a_j$  is,  $a_j$  is just a function here. That is what we started with. And we already seen that for, so, in other words say 0 form. So, we know that by the what we just did here  $k=0$  case, that will tell us that  $d\alpha$  is  $d$  of,  $d$  of  $a_j$  is 0. So,

the previous step implies that this term goes away and you are just left with negative  $j$  alpha wedge  $d\beta_j$ .

(Refer Slide Time: 15:19)

The image shows a digital whiteboard with handwritten mathematical derivations. The first part shows  $d\alpha = d(d\alpha_j) = 0$ . The second part shows  $d\beta_j = d(dx_{i_1} \wedge \dots \wedge dx_{i_k}) = \sum_i (-1)^{i-1} dx_{i_1} \wedge \dots \wedge d(dx_{i_i}) \wedge \dots \wedge dx_{i_k}$ , which then simplifies to 0 because  $d(dx_{i_i}) = 0$ .

$$d\alpha = d(d\alpha_j) = 0$$

$$d\beta_j = d(dx_{i_1} \wedge \dots \wedge dx_{i_k}) = \sum_i (-1)^{i-1} dx_{i_1} \wedge \dots \wedge d(dx_{i_i}) \wedge \dots \wedge dx_{i_k} = 0$$

And one just has to check that each for every multi index  $j$   $d\beta_j = 0$ , and that's quite easy because  $d\beta_j$  after all, what is it, this is  $d$  of, again, it is one just keeps on applying Leibnitz rule. So, one can check that basically one will keep on getting, see the one will end up keeping all these one forms fixed and taking  $d$  of one of the in between ones. Of course one has to start with the first one and so on. And then it will just what the sign you will acquire will depend on how many forms will precede that. So, therefore, you can write this as negative 1 to the power  $i$  and then right. So,  $d$  of  $x_{j1}$  wedge you have to basically, you will end up taking  $d$  of  $x_{ji}$ . So, your summation is over  $i$  dot dot dot  $dx_{jk}$ .

So, for instance, when I do the first, first one, I just get minus 1 to the power, minus 1, basically  $d$  of this actually here, yeah, it should be maybe I should change it, the index to  $i$  plus 1. I think that will be fine. So, or I might, yeah, let me write it as  $i$  minus 1 that is more clear, by minus 1. And then, yeah that makes sense. And then, right. So, one has this. And in the end, basically, one is again using this fact that if you have  $a$ ,  $d$  of a one form,  $d$  of,  $d$  of a function rather than that will be 0. So, the previous step, so, all these things are 0. So, essentially using the previous step, you, one gets it for all  $k$ . But ultimately, the fact that  $d$  compose with  $d$  boils around to the fact that mixed partial derivatives are equal. So, that proves  $d$  compose with  $d$  is 0.

(Refer Slide Time: 18:30)

4)  $F^*(d\omega) = d(F^*\omega)$ ,  $F: U \rightarrow V$   
 enough to consider forms of  $\omega = u dx_i$   $u \in C^0(V)$

Left side:  $F^*(du)(v) = d(u \circ F)(v)$   
 $F^*(du)(v) = du(dF(v)) = du \cdot dF(v) = d(u \circ F)(v)$

Right side:  $F^*(d(u dx_i)) = F^*(du \wedge dx_i) = F^*(du) \wedge F^*(dx_i)$   
 $= d(u \circ F) \wedge d(x_i \circ F) = \dots \wedge d(x_{i_k} \circ F)$

Bottom:  $F^*\omega = F^*(u) F^*(dx_i) = (u \circ F) d(x_i \circ F) \wedge \dots \wedge d(x_{i_k} \circ F)$

Now let us move on to the next one, which is the last one, which is the fourth one is  $F^* d\omega = d F^* \omega$ . Here  $F$  is a smooth map between two open sets in  $\mathbb{R}^n$  and  $\mathbb{R}^m$ , they may not be in the same Euclidean space. So, again enough to consider forms  $\omega$ , which are just the function times  $dx_i$ . So, here I am pulling back a form on  $V$ . So, this  $u$  will be a function on  $V$ . And the reason it is enough to consider forms of this type is the usual reason namely, any  $k$  form can be written as a sum of such forms and in this what we are trying to prove, in this expression, if we plug in, so, basically its both sides are linear in  $\omega$ . Therefore, if it is true for certain  $\omega_1$  and  $\omega_2$ , the equation will also be true for  $\omega_1$  plus  $\omega_2$ . Therefore, we can just restrict ourselves to forms of this type.

So, let us look at the left hand side  $F^* d\omega$ ,  $F^* u dx_i$ . And this will be  $F^*$ , again Leibnitz rule,  $du$  wedge  $dx_i$  plus, now here I will get minus 1 and then  $u$  times  $d$  of  $dx_i$  which we already seen is 0. So, I will not even write it. So, the second term will be 0. So, I will just get this and well, what is this? So, this is  $F^* du$  wedge  $F^* dx_i$ . Now  $F^* d u$  is it is quite straightforward to check that if you,  $F^* du$  is the same as  $d$  of  $u$  compose with  $F$ . And one can see this just by acting it on a tangent vector  $v$ .

Well, what is  $F^* du$  after all? This by definition is  $du$  acting on  $dF$  of  $v$  and this is the same thing as  $du$  composed with  $dF$  of  $v$ , which is  $du$  composed with  $F$  of  $v$  by chain rule. So, therefore one has this. So, this is  $d$  of  $u$  compose with  $F$ . Well, I do not

have to write the  $v$  here, wedge, now, as for this remember that  $dx_i$  was  $dx_i \wedge 1$  wedge  $dx_{i+1}$ . And we know that  $F^*$ , the pullback behaves well with respect to exterior multiplication, this has nothing to do with manifolds or smooth maps, this was just came from the multi linear algebra that we talked about a few lectures ago.

So, when I do  $F^* dx_i$ , I get  $F^* dx_i \wedge F^* dx_{i+1}$ . Let me write that a bit more clearly. So, this is  $F^* dx_i \wedge F^* dx_{i+1}$ . So, I will have this and also, let us, from what we just this, this thing here. This is the same as  $d$  of  $x_i \wedge 1$  composed with  $F$  etcetera  $d$  of  $x_{i+1}$  composed with  $F$ . So, what I end up with is,  $dx_i \wedge 1$  composed with  $F$  dot, dot, dot,  $dx_{i+1}$  composed with  $F$ . So, this is the left hand side now let us show that the right hand side leads to this exactly the same expression.

(Refer Slide Time: 25:05)

The image shows a digital whiteboard with handwritten mathematical derivations. The top section contains several equations:

$$\begin{aligned}
 &= du \cdot dF(u) \\
 &= d(u \circ F)(u) \\
 &= d(u \circ F) \wedge d(x_{i_1} \circ F) \wedge \dots \wedge d(x_{i_k} \circ F) \\
 &= d(x_{i_1} \circ F) \wedge \dots \wedge d(x_{i_k} \circ F)
 \end{aligned}$$

An arrow points from the second equation to the middle section, which shows the pullback of a  $k$ -form  $\omega$ :

$$\begin{aligned}
 F^* \omega &= F^*(u) F^*(dx_{i_1}) \wedge \dots \wedge F^*(dx_{i_k}) \\
 &= (u \circ F) d(x_{i_1} \circ F) \wedge \dots \wedge d(x_{i_k} \circ F)
 \end{aligned}$$

The bottom section shows the exterior derivative of the pullback:

$$d(F^* \omega) = d(u \circ F) \wedge d(x_{i_1} \circ F) \wedge \dots \wedge d(x_{i_k} \circ F)$$

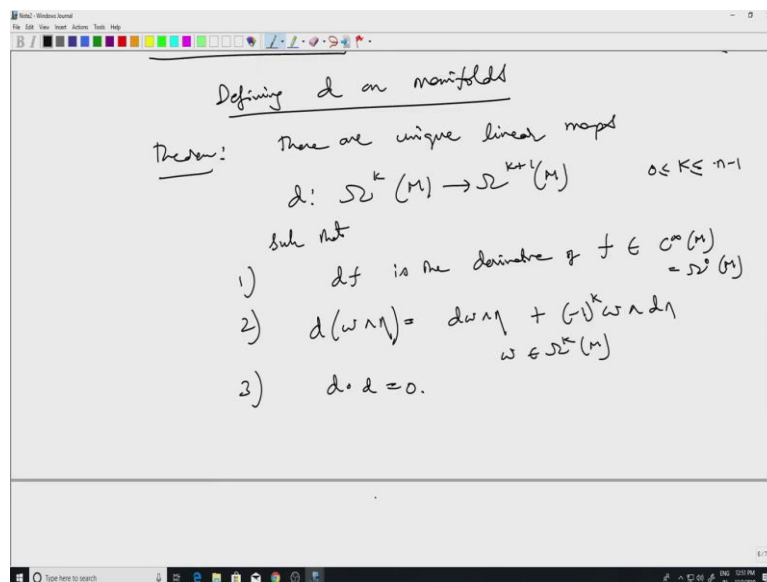

The whiteboard interface includes a toolbar at the top with various drawing tools and a Windows taskbar at the bottom.

Well,  $F^*$ , I have to start with  $F^* \omega$  and I go back to this expression here, so, this is  $F^*$ . So, this is 0 form and this is a  $k$  form. So, this is the same thing as  $F^* u$ , here the times  $F^* dx_i$ . This is the same as the pullback of a function, it is  $u$  composed with  $F$ , multiplied by again  $F^* dx_i$ , well I just use the same expression that I have here used this expression for  $F^* dx_i$  and then so, this will be  $dx_i \wedge 1$ , oops, not quite  $dx_i \wedge 1$ ,  $dx_i \wedge 1$  composed with  $F$ ,  $dx_{i+1}$  composed with  $F$ . Well essentially end up with the same thing on both sides. Now, not quite, we are not yet done. So, I have to take  $d$  of this. So,  $d$  of  $F^* \omega$ . Now, again the same thing, so, when I have to apply Leibnitz rule  $k$  times,  $k$  plus 1 times actually.

So, but all this when I take  $d$  of this other terms,  $d$  of any of these terms this, this and anything in between, I will end up getting 0. So, Leibnitz rule just gives me two terms, one is  $d$  of  $u$  composed with  $F$  wedge  $d$  of  $\xi_1$  composed with  $F$ , well actually it gives me just one term which is non 0, which is this. So, just differentiating the function. So, and this and this if one compares they are the same. So, we have proved that pullbacks behave well with respect to exterior differentiation. So, once we have this in hand, now we can, this completes our discussion for exterior forms in  $\mathbb{R}^n$ . Now we can move on, go to manifolds and prove the main result, which is basically the existence and uniqueness of this  $d$  operator.

(Refer Slide Time: 28:34)

So, now, let us recall what we were trying to prove, the theorem was that there are unique linear maps  $d$  from  $\Omega^k M$  to  $\Omega^{k+1} M$  and so, here  $k$  varies between 0 and well, if the dimension of the manifold is  $n$ , we know that any  $n+1$  form or basically any  $k$  form where  $k$  is strictly greater than  $n$  will be 0. So, I might as well say that  $k$  less than or equal to  $n-1$  because here I have written  $k+1$ . They are unique linear maps such that  $df$ , so for a 0 form and we have the Leibnitz rule,  $d(\omega \wedge \eta) = d\omega \wedge \eta + (-1)^k \omega \wedge d\eta$  where  $\omega$  belongs to  $\Omega^k M$ .

Third one is  $d \circ d = 0$ . So, we also have additional properties which are satisfied by  $d$ . But these are the three main things the additional properties are consequences of these, well not quite consequences, the way they are constructed the

additional properties will follow. The uniqueness just follows from these three actions.  
So, let us stop here. We will resume from next time.
