Laminar Boundary Layers

In the previous lectures, having derived the equations of bulk mass conservation, the momentum equations, the mass transport equation and the energy transport equation, we are now ready to take up their application to a special class of flows which are called boundary layer flows.

I will be beginning with boundary layer flows, which are in laminar state. Today's lecture is to derive appropriate equations for laminar velocity bounded errors and scalar bounded errors.

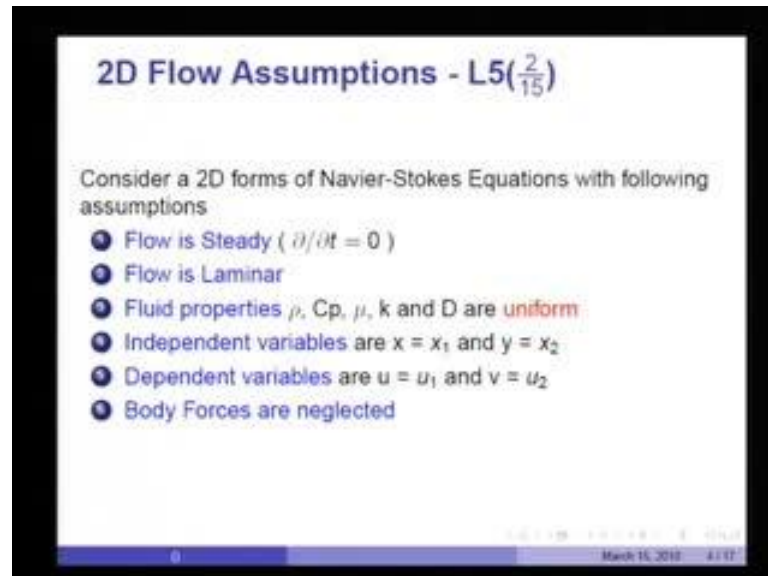

(Refer Slide Time: 01:03)

The purpose is to derive 2 dimensional flow and scalar transport equations to invoke the boundary layer approximations, to write out 2 dimensional velocity boundary layer

equations and to write out 2 dimensional temperature and concentration boundary layer equations.

(Refer Slide Time: 01:32)

Then very briefly mention the methods of solution, which we shall be developing in the course of lectures. Recall that our 3D Navier Stokes equations were written in this manner $\rho \frac{dU_j}{dt} = \rho U_j \frac{dU_j}{dx_j} = 0$.

Then there were 3 momentum equations; one each in direction x_1 , x_2 and x_3 and it comprised of unsteady term, the convection term, the pressure gradient term, the diffusion term and the body force term.

This is the second part of the stress term that gives rise to $\frac{d}{dx_j} \mu \frac{dU_j}{dx_i}$. Further, we are going to make certain assumptions because as I said we are we want to avoid use of numerical methods and try to achieve as much as possible by analytical means.

This requires that we make certain assumptions- the first assumption is the flow is steady $\frac{d}{dt} = 0$. I am not at all suggesting that analytical solutions to unsteady flow are not possible but then our main interest in this course is to deal with steady flows in equipments.

Therefore, I will take assume that d by dt equal to 0. I would say that the flow is laminar and perhaps the most important assumption here is that all properties the intrinsic properties, density and specific heat and the transport properties μ , k and d are uniform.

You will recall μ arose out of Stokes's stress and strain loss, k arose out of the Fourier's law of heat conduction and d arose out of the Fick's law of mass diffusion. We are going to say that they are all uniform.

That means they do not vary with position in the flow and therefore for all practical purposes they are constants in space. I will also now, since we are dealing with 2 dimensions, I will instead of writing x_1 x_2 , I shall write x and y by saying x is equal to x_1 and y is equal to x_2 .

(Refer Slide Time: 04:21)

2D Flow Equations L5($\frac{3}{15}$)

Continuity Equation

$$\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} = 0 \quad (3)$$

x-Momentum Equation

$$\rho \left[u \frac{\partial u}{\partial x} + v \frac{\partial u}{\partial y} \right] = -\frac{\partial p}{\partial x} + \mu \left[\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} \right] \quad (4)$$

y-Momentum Equation

$$\rho \left[u \frac{\partial v}{\partial x} + v \frac{\partial v}{\partial y} \right] = -\frac{\partial p}{\partial y} + \mu \left[\frac{\partial^2 v}{\partial x^2} + \frac{\partial^2 v}{\partial y^2} \right] \quad (5)$$

March 15, 2010 5:17

And the dependent variables, I would change to u equal to u_1 and v equal to u_2 and body forces which are essentially problem specific are presently to be ignored. So with this assumption you will notice our mass conservation equation would simply because density is constant would reduce to du by dx plus dv by dy .

(Refer Slide Time: 04:34)

3D Navier Stokes Equations - L5($\frac{1}{15}$)

Mass Conservation equation

$$\frac{\partial(\rho_m)}{\partial t} + \frac{\partial(\rho_m u_j)}{\partial x_j} = 0 \quad (1)$$

Momentum equation in X_i direction (3 equations)

$$\frac{\partial(\rho_m u_i)}{\partial t} + \frac{\partial(\rho_m u_j u_i)}{\partial x_j} = -\frac{\partial p}{\partial x_i} + \frac{\partial}{\partial x_j} \left[\mu \frac{\partial u_i}{\partial x_j} \right] + \rho_m B_i + \frac{\partial}{\partial x_j} \left[\mu \frac{\partial u_j}{\partial x_i} \right] \quad (2)$$

March 15, 2012 5/17

I can go back a little to see, if density is constant then that term is 0 and this term rho m du j by dx j equal to 0 would simply be du 1 by dx 1 plus du 2 by dx 2 equal to 0. Therefore, that will simply read as du by dx plus dv by dy equal to 0.

(Refer Slide Time: 04:49)

2D Flow Equations L5($\frac{3}{15}$)

Continuity Equation

$$\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} = 0 \quad (3)$$

x-Momentum Equation

$$\rho \left[u \frac{\partial u}{\partial x} + v \frac{\partial u}{\partial y} \right] = -\frac{\partial p}{\partial x} + \mu \left[\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} \right] \quad (4)$$

y-Momentum Equation

$$\rho \left[u \frac{\partial v}{\partial x} + v \frac{\partial v}{\partial y} \right] = -\frac{\partial p}{\partial y} + \mu \left[\frac{\partial^2 v}{\partial x^2} + \frac{\partial^2 v}{\partial y^2} \right] \quad (5)$$

March 15, 2012 6/17

The x momentum equation or the momentum equation in x direction would read as rho times u du by dx plus v du by dy equal to minus dp dx plus mu d 2 u dx square and d 2 u dy square.

(Refer Slide Time: 05:16)

3D Navier Stokes Equations - L5($\frac{1}{15}$)

Mass Conservation equation

$$\frac{\partial(\rho_m)}{\partial t} + \frac{\partial(\rho_m u_i)}{\partial x_j} = 0 \quad (1)$$

Momentum equation in X_i direction (3 equations)

$$\frac{\partial(\rho_m u_i)}{\partial t} + \frac{\partial(\rho_m u_j u_i)}{\partial x_j} = -\frac{\partial p}{\partial x_i} + \frac{\partial}{\partial x_j} \left[\mu \frac{\partial u_i}{\partial x_j} \right] + \rho_m B_i + \frac{\partial}{\partial x_j} \left[\mu \frac{\partial u_j}{\partial x_i} \right] \quad (2)$$

March 15, 2010 5/17

This requires little explanation. For example, if μ is constant then, $\frac{\partial}{\partial x_j} \left[\mu \frac{\partial u_j}{\partial x_i} \right]$ would simply be written as $\mu \frac{\partial^2 u_j}{\partial x_j \partial x_i}$ or if I may use the paper you will see that, $\frac{\partial}{\partial x_j} \left[\mu \frac{\partial u_j}{\partial x_i} \right]$ of $\mu \frac{\partial^2 u_j}{\partial x_j \partial x_i}$ would be $\mu \frac{\partial^2 u_j}{\partial x_j \partial x_i}$, that will be equal to $\mu \frac{\partial}{\partial x_i} \left[\frac{\partial u_j}{\partial x_j} \right]$ and that is 0 by continuity equations for constant density $\frac{\partial u_j}{\partial x_j}$ is equal to 0.

(Refer Slide Time: 05:37)

$$\begin{aligned} & \frac{\partial}{\partial x_j} \left[\mu \frac{\partial u_j}{\partial x_i} \right] \\ &= \mu \frac{\partial^2 u_j}{\partial x_j \partial x_i} \\ &= \mu \frac{\partial}{\partial x_i} \left[\frac{\partial u_j}{\partial x_j} \right] \end{aligned}$$

(Refer Slide Time: 06:13)

3D Navier Stokes Equations - L5($\frac{1}{15}$)

Mass Conservation equation

$$\frac{\partial(\rho m)}{\partial t} + \frac{\partial(\rho m u_j)}{\partial x_j} = 0 \quad (1)$$

Momentum equation in X_i direction (3 equations)

$$\frac{\partial(\rho m u_i)}{\partial t} + \frac{\partial(\rho m u_j u_i)}{\partial x_j} = -\frac{\partial p}{\partial x_i} + \frac{\partial}{\partial x_j} \left[\mu \frac{\partial u_i}{\partial x_j} \right] + \rho m B_i + \frac{\partial}{\partial x_j} \left[\mu \frac{\partial u_j}{\partial x_i} \right] \quad (2)$$

March 15, 2010 3/11

(Refer Slide Time: 06:31)

Therefore, this term simply vanishes. Now, let us look at this term - says that d by dx_j of $\mu \frac{\partial u_i}{\partial x_j}$ for constant viscosity. This will be d by dx_j u_i and in 2 dimension; this will simply be du_1 by dx_1 $d^2 u_1$ by dx_1^2 plus $d^2 u_1$ by dx_2^2 and with our replacements μ this will be $d^2 U$ by dx^2 plus $d^2 u$ by dy^2 . So that explains, how that term would modify, we will look at this term now.

(Refer Slide Time: 07:27)

3D Navier Stokes Equations - L5($\frac{1}{15}$)

Mass Conservation equation

$$\frac{\partial(\rho m)}{\partial t} + \frac{\partial(\rho m u_j)}{\partial x_j} = 0 \quad (1)$$

Momentum equation in X_i direction (3 equations)

$$\frac{\partial(\rho m u_i)}{\partial t} + \frac{\partial(\rho m u_j u_i)}{\partial x_j} = -\frac{\partial p}{\partial x_i} + \frac{\partial}{\partial x_j} \left[\mu \frac{\partial u_i}{\partial x_j} \right] + \rho m B_i + \frac{\partial}{\partial x_j} \left[\mu \frac{\partial u_j}{\partial x_i} \right] \quad (2)$$

March 15, 2010 31/37

(Refer Slide Time: 07:37)

Handwritten derivation of the continuity equation for constant density and steady flow:

$$\begin{aligned} & \frac{\partial(\rho m u_i)}{\partial t} + \frac{\partial(\rho m u_j u_i)}{\partial x_j} \\ &= \rho m \frac{\partial u_i}{\partial t} + \rho m u_j \frac{\partial u_i}{\partial x_j} + \rho m u_i \frac{\partial u_j}{\partial x_j} \\ &= \rho m u_j \frac{\partial u_i}{\partial x_j} \\ &= \rho m \left[u_1 \frac{\partial u_i}{\partial x_1} + u_2 \frac{\partial u_i}{\partial x_2} \right] - \rho u_i \frac{\partial u_j}{\partial x_j} \\ &= \rho m \left[u_1 \frac{\partial u_i}{\partial x_1} + u_2 \frac{\partial u_i}{\partial x_2} \right] - \rho u_i \frac{\partial u_j}{\partial x_j} \end{aligned}$$

For constant density and steady flow, you have $\frac{d(\rho m u_i)}{dt} + \frac{d(\rho m u_j u_i)}{dx_j}$ and for constant density, this will simply become $\rho m \frac{du_i}{dt} + \rho m u_j \frac{du_i}{dx_j} + \rho m u_i \frac{du_j}{dx_j}$.

Now, in a steady flow that is 0 and due to mass conservation equation $\frac{du_j}{dx_j}$ is 0. Therefore, this will become $\frac{d(\rho m u_j)}{dx_j}$ or in 2 dimension; this will become simply $u_1 \frac{du_1}{dx_1} + u_2 \frac{du_1}{dx_2}$ in x direction.

(Refer Slide Time: 09:10)

2D Flow Equations L5($\frac{3}{15}$)

Continuity Equation

$$\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} = 0 \quad (3)$$

x-Momentum Equation

$$\rho \left[u \frac{\partial u}{\partial x} + v \frac{\partial u}{\partial y} \right] = -\frac{\partial p}{\partial x} + \mu \left[\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} \right] \quad (4)$$

y-Momentum Equation

$$\rho \left[u \frac{\partial v}{\partial x} + v \frac{\partial v}{\partial y} \right] = -\frac{\partial p}{\partial y} + \mu \left[\frac{\partial^2 v}{\partial x^2} + \frac{\partial^2 v}{\partial y^2} \right] \quad (5)$$

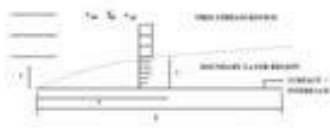

March 15, 2010 6/17

It will return $\rho m u \frac{1}{2} \frac{du^2}{dx} + u \frac{1}{2} \frac{du^2}{dx}$ in x direction. You will see now, that how these terms have been modified to read like that. So, you will see in x direction for example there is $\rho m u \frac{1}{2} \frac{du^2}{dx}$ which is $\rho u \frac{du}{dx}$ plus $u \frac{du}{dx}$ which is $v \frac{du}{dy}$ equal to $-\frac{dp}{dx}$ and the 2 diffusion terms that I mentioned.

(Refer Slide Time: 09:51)

BL Concept L5($\frac{4}{15}$)

- 1 The concept of the wall boundary layer was first introduced by L. Prandtl in 1904 to theoretically predict the **drag** experienced by a body immersed in a flowing fluid.
- 2 Prandtl identified a thin viscosity affected region close to a surface in which **significant velocity variations** take place.
- 3 Outside the Boundary Layer, Free Stream is **Inviscid**

Define

- 1 $x^* = x/L, y^* = y/L$
- 2 $u^* = u/U_\infty, v^* = v/U_\infty$
- 3 $p^* = p/(\rho U_\infty^2), Re = \frac{\rho U_\infty L}{\mu}$
- 4 $\delta \ll X, u \gg v$

L and U_∞ are reference length & velocity

March 15, 2010 6/17

Similarly, in the y direction you would have that term. So, these are the equations of flow of a uniform property laminar 2 dimensional flow. We shall now invoke the boundary layer concept and this is perhaps the most important slide for you to remember.

Now, the concept of boundary layer near a wall was first introduced by Ludwig Prandtl in 1904, to theoretically predict the drag experienced by a body when it was immersed in a flowing fluid.

Ships experience drag, motor cars driving in a motorway experience drag, aircrafts experience drag and these drags are substantial. You have to expend energy to overcome them and therefore it is very important that how much is the drag offered by a body when it when the fluid flows past it.

Prandtl suggested that you do not need to consider the total flow around a body, but nearly concentrate on a thin region very close to the wall as shown here, which he called the boundary layer region. In this region that significant velocity variations take place.

(Refer Slide Time: 11:18)

2D Flow Equations L5($\frac{3}{15}$)

Continuity Equation

$$\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} = 0 \quad (3)$$

x-Momentum Equation

$$\rho \left[u \frac{\partial u}{\partial x} + v \frac{\partial u}{\partial y} \right] = -\frac{\partial p}{\partial x} + \mu \left[\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} \right] \quad (4)$$

y-Momentum Equation

$$\rho \left[u \frac{\partial v}{\partial x} + v \frac{\partial v}{\partial y} \right] = -\frac{\partial p}{\partial y} + \mu \left[\frac{\partial^2 v}{\partial x^2} + \frac{\partial^2 v}{\partial y^2} \right] \quad (5)$$

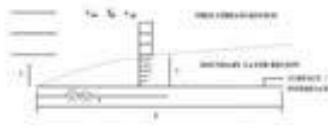

March 15, 2010 5/17

And it is the region, in which viscosity of the fluid is dominates the determinant of flow. In other words, **viscosity viscous** terms dominate very close to the wall. As you move away from the wall, the importance of these terms becomes even more negligible and it is these terms which mainly dominate in the far away from a solid surface.

(Refer Slide Time: 11:41)

BL Concept L5($\frac{4}{15}$)

- 1 The concept of the wall boundary layer was first introduced by L. Prandtl in 1904 to theoretically predict the *drag* experienced by a body immersed in a flowing fluid.
- 2 Prandtl identified a thin viscosity affected region close to a surface in which significant velocity variations take place.
- 3 Outside the Boundary Layer, Free Stream is *Inviscid*

Define

- 1 $x^* = x/L, y^* = y/L$
- 2 $u^* = u/U_\infty, v^* = v/U_\infty$
- 3 $p^* = p/(\rho U_\infty^2), Re = \frac{\rho U_\infty L}{\mu}$
- 4 $\delta \ll X, u \gg v$

L and U_∞ are reference length & velocity

March 15, 2010 8/11

Prandtl called the thin and long region near a wall as the boundary layer region, by long and thin may mean that the dimension lateral to the flow delta at any point x in the flow delta is much smaller than x.

That is what we mean by long and thin flows passed the surface or an interface the region outside where a lateral velocity gradient are almost negligible is called the free stream region. In the free stream, there is velocity u infinity t infinity and a conserved property phi infinity.

Now, to develop this mathematical interpretation of this concept of long and thin flow close to a wall, we are going to introduce dimensionless variables. So, x star would be written as x divided by L, y star would be written as y divided by l, u star would be written as u divided by U infinity, v star would be written as v divided by u infinity, p star as p divided by rho infinity square, Re as U infinity, L by nu this is the reynolds number corresponding to reference length L and assumption is delta is much less than X and u the velocity in x direction is much greater than v.

It is this condition, which ensures that, in a boundary layer conditions of the properties of the flow at one cross section are influenced only by the upstream conditions. The conditions downstream have no influence on the conditions at a given cross section.

(Refer Slide Time: 13:49)

Non-Dimensionalised Equations L5($\frac{5}{15}$)

$$\frac{\partial u^*}{\partial x^*} + \frac{\partial v^*}{\partial y^*} = 0 \quad (6)$$

$$\frac{1}{1} + \frac{\delta^*}{\delta^*}$$

$$u^* \frac{\partial u^*}{\partial x^*} + v^* \frac{\partial u^*}{\partial y^*} = -\frac{\partial p^*}{\partial x^*} + \frac{1}{Re} \left[\frac{\partial^2 u^*}{\partial x^{*2}} + \frac{\partial^2 u^*}{\partial y^{*2}} \right] \quad (7)$$

$$1 \frac{u^*}{1} + \delta^* \frac{u^*}{\delta^*} = O(1) + (\delta^{*2}) \left[\frac{u^*}{1} + \frac{u^*}{\delta^{*2}} \right]$$

$$u^* \frac{\partial v^*}{\partial x^*} + v^* \frac{\partial v^*}{\partial y^*} = -\frac{\partial p^*}{\partial y^*} + \frac{1}{Re} \left[\frac{\partial^2 v^*}{\partial x^{*2}} + \frac{\partial^2 v^*}{\partial y^{*2}} \right] \quad (8)$$

$$1 \frac{v^*}{1} + \delta^* \frac{v^*}{\delta^*} = \delta^* + (\delta^{*2}) \left[\frac{v^*}{1} + \frac{v^*}{\delta^{*2}} \right]$$

March 15, 2010 7/17

L and U infinity are simply the reference length and reference velocity. Each of these **quantity start quantities** is a dimensionless quantity and therefore the equations would read like this. So, let us look at the first equation after non dimensionalization.

(Refer Slide Time: 14:01)

$\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} = 0$
 $\frac{u_\infty}{L} \frac{\partial u^*}{\partial x^*} + \frac{u_\infty}{L} \frac{\partial v^*}{\partial y^*} = 0$
 $\frac{u_\infty}{L} \left[\frac{\partial u^*}{\partial x^*} + \frac{\partial v^*}{\partial y^*} \right] = 0$

You will see that du by dx plus dv by dy equal to 0. If I make this u to u^* , it will become u^* 's infinity du^* by dx^* , which means divided by L and likewise u infinity dv^* by dy^* divided by L equal to 0.

(Refer Slide Time: 14:43)

Non-Dimensionalised Equations L5($\frac{5}{15}$)

$$\frac{\partial u^*}{\partial x^*} + \frac{\partial v^*}{\partial y^*} = 0 \quad (6)$$

$$\frac{1}{1} + \frac{\delta^*}{\delta^*}$$

$$u^* \frac{\partial u^*}{\partial x^*} + v^* \frac{\partial u^*}{\partial y^*} = -\frac{\partial p^*}{\partial x^*} + \frac{1}{Re} \left[\frac{\partial^2 u^*}{\partial x^{*2}} + \frac{\partial^2 u^*}{\partial y^{*2}} \right] \quad (7)$$

$$1 \frac{1}{1} + \delta^* \frac{1}{\delta^*} = O(1) + (\delta^{*2}) \left[\frac{1}{\delta^*} + \frac{1}{\delta^{*2}} \right]$$

$$u^* \frac{\partial v^*}{\partial x^*} + v^* \frac{\partial v^*}{\partial y^*} = -\frac{\partial p^*}{\partial y^*} + \frac{1}{Re} \left[\frac{\partial^2 v^*}{\partial x^{*2}} + \frac{\partial^2 v^*}{\partial y^{*2}} \right] \quad (8)$$

$$1 \frac{1}{1} + \delta^* \frac{1}{\delta^*} = \delta^* + (\delta^{*2}) \left[\frac{1}{\delta^*} + \frac{1}{\delta^{*2}} \right]$$

March 15, 2016 7:07

So, it is u infinity by L du star by dx star plus dv star by dy star equal to 0 and that is what I have written in equation number 6 here du star by dx star plus dv star by dy star equal to 0. Likewise, let us look at the momentum equation.

(Refer Slide Time: 14:56)

The image shows handwritten mathematical work on a whiteboard. It starts with the momentum equation in dimensional form: $\rho [u \frac{\partial u}{\partial x} + v \frac{\partial u}{\partial y}] = -\frac{\partial p}{\partial x} + \mu \left[\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} \right]$. This is then divided by $\rho U_0^2 L$ to non-dimensionalize it, resulting in $u^* \frac{\partial u^*}{\partial x^*} + v^* \frac{\partial u^*}{\partial y^*} = -\frac{\partial p^*}{\partial x^*} + \frac{\mu}{\rho U_0 L} \left[\frac{\partial^2 u^*}{\partial x^{*2}} + \frac{\partial^2 u^*}{\partial y^{*2}} \right]$. The final step shows the definition of the Reynolds number: $\frac{\mu}{\rho U_0 L} = \frac{1}{Re}$.

The Momentum equation was written as ρ times u du by dx plus v du by dy equal to minus dp by dx plus μ times d^2u by dx square plus d^2u by dy square. If, I non-dimensionalize this equation I will have ρ u infinity square giving me u star du star by

dx^* , which is $L + v^* \frac{du^*}{dy^*} - \rho u^* \frac{dp^*}{dx^*}$ divided by $L dx^*$.

All this is equal to $\mu U \frac{d^2u^*}{dx^{*2}} + \frac{d^2u^*}{dy^{*2}}$. If I divide through by this quantity, you will see I will get $u^* \frac{du^*}{dx^*} + v^* \frac{du^*}{dy^*} = -\frac{dp^*}{dx^*} + \frac{\mu U}{\rho U^2 L} \frac{d^2u^*}{dx^{*2}} + \frac{d^2u^*}{dy^{*2}}$. So, what is this group? This is simply μ divided by $\rho U L$ and that is nothing but 1 over Reynolds number.

(Refer Slide Time: 17:13)

Non-Dimensionalised Equations L5(5/15)

$$\frac{\partial u^*}{\partial x^*} + \frac{\partial v^*}{\partial y^*} = 0 \quad (6)$$

$$\frac{1}{1} + \frac{\delta^*}{\delta^*}$$

$$u^* \frac{\partial u^*}{\partial x^*} + v^* \frac{\partial u^*}{\partial y^*} = -\frac{\partial p^*}{\partial x^*} + \frac{1}{Re} \left[\frac{\partial^2 u^*}{\partial x^{*2}} + \frac{\partial^2 u^*}{\partial y^{*2}} \right] \quad (7)$$

$$1 \frac{1}{1} + \delta^* \frac{1}{\delta^*} = O(1) + (\delta^{*2}) \left[\frac{1}{\delta^*} + \frac{1}{\delta^{*2}} \right]$$

$$u^* \frac{\partial v^*}{\partial x^*} + v^* \frac{\partial v^*}{\partial y^*} = -\frac{\partial p^*}{\partial y^*} + \frac{1}{Re} \left[\frac{\partial^2 v^*}{\partial x^{*2}} + \frac{\partial^2 v^*}{\partial y^{*2}} \right] \quad (8)$$

$$1 \frac{1}{1} + \delta^* \frac{1}{\delta^*} = \delta^* + (\delta^{*2}) \left[\frac{1}{\delta^*} + \frac{1}{\delta^{*2}} \right]$$

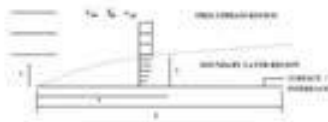

March 15, 2010 11/17

So, this equation is equation 7, $u^* \frac{du^*}{dx^*} + v^* \frac{du^*}{dy^*} - \frac{dp^*}{dx^*} + \frac{1}{Re} \frac{d^2u^*}{dx^{*2}} + \frac{d^2u^*}{dy^{*2}}$. If I have to non-dimensionalize the v momentum equation, it would appear very similar to that equation with $\frac{dp^*}{dy^*}$, here the dependent variable would be v^* and again divided by Reynolds number.

(Refer Slide Time: 17:59)

BL Concept L5($\frac{4}{15}$)

- The concept of the wall boundary layer was first introduced by L. Prandtl in 1904 to theoretically predict the *drag* experienced by a body immersed in a flowing fluid.
- Prandtl identified a thin viscosity affected region close to a surface in which significant velocity variations take place.
- Outside the Boundary Layer, Free Stream is *Inviscid*

Define

- $x^* = x/L, y^* = y/L$
- $u^* = u/U_\infty, v^* = v/U_\infty$
- $p^* = p/(\rho U_\infty^2), Re = \frac{\rho U_\infty L}{\mu}$
- $\delta \ll X, u \gg v$

L and U_∞ are reference length & velocity

Now, I am going to do an order of magnitude analysis of this equation. So, we said u is considered of the order of 1 and x is considered of the order 1. Then, according to this assumption y dimension would be of the order of delta.

(Refer Slide Time: 18:06)

Non-Dimensionalised Equations L5($\frac{5}{15}$)

$$\frac{\partial u^*}{\partial x^*} + \frac{\partial v^*}{\partial y^*} = 0 \quad (6)$$

$$\frac{1}{1} + \frac{\delta^*}{\delta^*}$$

$$u^* \frac{\partial u^*}{\partial x^*} + v^* \frac{\partial u^*}{\partial y^*} = -\frac{\partial p^*}{\partial x^*} + \frac{1}{Re} \left[\frac{\partial^2 u^*}{\partial x^{*2}} + \frac{\partial^2 u^*}{\partial y^{*2}} \right] \quad (7)$$

$$1 \frac{1}{1} + \delta^* \frac{1}{\delta^*} = O(1) + (\delta^{*2}) \left[\frac{1}{1} + \frac{1}{\delta^{*2}} \right]$$

$$u^* \frac{\partial v^*}{\partial x^*} + v^* \frac{\partial v^*}{\partial y^*} = -\frac{\partial p^*}{\partial y^*} + \frac{1}{Re} \left[\frac{\partial^2 v^*}{\partial x^{*2}} + \frac{\partial^2 v^*}{\partial y^{*2}} \right] \quad (8)$$

$$1 \frac{1}{1} + \delta^* \frac{1}{\delta^*} = \delta^* + (\delta^{*2}) \left[\frac{1}{\delta^*} + \frac{1}{\delta^{*2}} \right]$$

The v velocity will also be of the order of delta and that is what I have done. So, 1 divided by 1 plus delta star by delta star order of delta star and what this shows is that both the terms are of the order unity. Therefore, neither could be ignored in this equation.

(Refer Slide Time: 19:40)

Handwritten notes on a whiteboard showing the order of terms in a fluid dynamics equation. The equation is:

$$u^* \frac{du^*}{dx^*} + v^* \frac{dv^*}{dy^*} = -\frac{dp^*}{dx^*} + \frac{1}{Re} \left[\frac{d^2 u^*}{dx^{*2}} + \frac{d^2 u^*}{dy^{*2}} \right]$$

The left side terms are identified as $O(1) + O(1) = O(1)$. The right side terms are identified as $O(1)$ for the pressure gradient and $O(1)$ for the diffusion terms, with a note that $Re = \frac{1}{\Sigma}$.

So, $u^* \frac{du^*}{dx^*}$ and $v^* \frac{dv^*}{dy^*}$ is equal to 0. Remember, here both numerator and denominators are of the order 1. Here, both are of the order delta but it is the derivative, which is most important and both derivatives are of the same order.

Likewise, let us do this for momentum equation. Then, u^* is of order 1, $u^* \frac{du^*}{dx^*}$ is 1 by 1. This is of the order delta u^* is of the order 1 divided by y^* , which is delta and therefore each term on the left hand side is of order.

I will now turn my attention straightaway to the diffusion terms. Then, you will see this term is order of 1 by 1 square. Whereas, this term is 1 divided by delta square and it is quite obvious that this term would usually dominate over this term because delta is so much smaller than 1. In this equation, $u^* \frac{du^*}{dx^*} + v^* \frac{dv^*}{dy^*} = -\frac{dp^*}{dx^*} + \frac{1}{Re} \left[\frac{d^2 u^*}{dx^{*2}} + \frac{d^2 u^*}{dy^{*2}} \right]$.

This term is much bigger than this term and therefore I will drop that term. Now, this term as a whole is of the order of 1. This is although of the order 1 and this term is of the order delta square delta square

But Prandtl did say that, you must have effect of viscosity included if you wanted to predict the drag, which means one of these two terms must be included. We have already decided to drop this term. So, if this term is included, if an all terms are of order 1 then

Reynolds number or 1 over Reynolds number must be of order 1 or I mean order delta square.

So that, Reynolds number is proportional to one over delta square, this is a large quantity. So that, the delta square would get canceled with this delta square and the total term would then be of order 1 and likewise I can say therefore by deduction this term would also be of order 1.

(Refer Slide Time: 21:46)

Non-Dimensionalised Equations L5($\frac{5}{15}$)

$$\frac{\partial u^*}{\partial x^*} + \frac{\partial v^*}{\partial y^*} = 0 \quad (6)$$

$$\frac{1}{1} + \frac{\delta^*}{\delta^*}$$

$$u^* \frac{\partial u^*}{\partial x^*} + v^* \frac{\partial u^*}{\partial y^*} = -\frac{\partial p^*}{\partial x^*} + \frac{1}{Re} \left[\frac{\partial^2 u^*}{\partial x^{*2}} + \frac{\partial^2 u^*}{\partial y^{*2}} \right] \quad (7)$$

$$1 \frac{1}{1} + \delta^* \frac{1}{\delta^*} = O(1) + (\delta^{*2}) \left[\frac{1}{\delta^*} + \frac{1}{\delta^{*2}} \right]$$

$$u^* \frac{\partial v^*}{\partial x^*} + v^* \frac{\partial v^*}{\partial y^*} = -\frac{\partial p^*}{\partial y^*} + \frac{1}{Re} \left[\frac{\partial^2 v^*}{\partial x^{*2}} + \frac{\partial^2 v^*}{\partial y^{*2}} \right] \quad (8)$$

$$1 \frac{\delta^*}{\delta^*} + \delta^* \frac{\delta^*}{\delta^*} = \delta^* + (\delta^{*2}) \left[\frac{\delta^*}{\delta^*} + \frac{\delta^*}{\delta^{*2}} \right]$$

March 15, 2012 11:17

(Refer Slide Time: 22:02)

Handwritten derivations on a whiteboard:

$$u^* + v^* \frac{\partial v^*}{\partial y^*} = -\frac{\partial p^*}{\partial y^*}$$

$$1 \frac{\delta^*}{\delta^*} + \delta^* \frac{\delta^*}{\delta^*} = O(\delta^*)$$

$$\frac{1}{Re} \left[\frac{\partial^2 v^*}{\partial x^{*2}} + \frac{\partial^2 v^*}{\partial y^{*2}} \right] = \delta^{*2} \left[\frac{1}{\delta^*} + \frac{1}{\delta^{*2}} \right] + O(\delta^{*3})$$

$$\frac{\partial p^*}{\partial y^*} = O(\delta^*)$$

$$\frac{\partial p^*}{\partial x^*} = -\frac{\partial p^*}{\partial x^*} = O(\delta^*)$$

Annotations: "negligible" with an arrow pointing to the $O(\delta^*)$ term in the pressure gradient equation.

So, the only term that is dropped now, that can be dropped is du^* by dx^* square, all other terms are of order 1. Let us examine likewise the v momentum equation, then you will see that the v momentum equation is $u^* dv^*$ by dx^* plus $v^* dv^*$ by $dx^* dy^*$ equal to minus dp^* by dy^* plus 1 over Reynolds number into d^2v^* by dx^* plus d^2v^* by dy^* square.

This is $1 \delta^*$ by 1 plus δ^* δ^* by δ^* . So, you will notice that the left hand side is of order δ^* square. We have agreed that 1 over Reynolds number shall be of order δ^* square multiplied by 1 plus δ^* by δ^* square.

And again you will see that, if I take δ^* common then I have δ^* cube is a 1 plus 1 over δ^* square. So, you will see that the first term is again much smaller than the second term because the first term is of order 1 the second term is of order δ^* square and therefore that can be neglected but the total term again is of order δ^* .

(Refer Slide Time: 24:01)

Non-Dimensionalised Equations L5(5/15)

$$\frac{\partial u^*}{\partial x^*} + \frac{\partial v^*}{\partial y^*} = 0 \quad (6)$$

$$\frac{1}{1} + \frac{\delta^*}{\delta^*}$$

$$u^* \frac{\partial u^*}{\partial x^*} + v^* \frac{\partial u^*}{\partial y^*} = -\frac{\partial p^*}{\partial x^*} + \frac{1}{Re} \left[\frac{\partial^2 u^*}{\partial x^{*2}} + \frac{\partial^2 u^*}{\partial y^{*2}} \right] \quad (7)$$

$$1 \frac{\delta^*}{\delta^*} + \delta^* \frac{\delta^*}{\delta^*} = O(1) + (\delta^{*2}) \left[\frac{1}{\delta^*} + \frac{1}{\delta^{*2}} \right]$$

$$u^* \frac{\partial v^*}{\partial x^*} + v^* \frac{\partial v^*}{\partial y^*} = -\frac{\partial p^*}{\partial y^*} + \frac{1}{Re} \left[\frac{\partial^2 v^*}{\partial x^{*2}} + \frac{\partial^2 v^*}{\partial y^{*2}} \right] \quad (8)$$

$$1 \frac{\delta^*}{\delta^*} + \delta^* \frac{\delta^*}{\delta^*} = O(1) + (\delta^{*2}) \left[\frac{\delta^*}{\delta^*} + \frac{\delta^*}{\delta^{*2}} \right]$$

So, each term in this equation is of the order δ^* and therefore dp^* by dy^* will be of order δ^* square. So, we conclude that in the x momentum equation each term is of order one.

Whereas, in the v momentum equation or the y momentum equation each term is of order δ^* . Therefore, this equation as the whole can be ignored in preference to that

equation, which is much bigger so and the principle deduction from this is that dp^* by dy^* is of the order δ^* or can be taken as 0.

What this says is that, in a boundary layer in a long and thin flow the pressure variations is negligible in y direction. In fact, I can say that from this it follows that dp^* by dx^* now would essentially be dp^* by dx^* , which I can also write as dp^* infinity by dx^* . Which is also equal to dp^* whole star by dx^* . I can measure the pressure at the wall in a given flow and I would get the quantity dp^* by dx^* .

(Refer Slide Time: 25:46)

Non-Dimensionalised Equations L5($\frac{5}{15}$)

$$\frac{\partial u^*}{\partial x^*} + \frac{\partial v^*}{\partial y^*} = 0 \quad (6)$$

$$\frac{1}{1} + \frac{\delta^*}{\delta^*}$$

$$u^* \frac{\partial u^*}{\partial x^*} + v^* \frac{\partial u^*}{\partial y^*} = -\frac{\partial p^*}{\partial x^*} + \frac{1}{Re} \left[\frac{\partial^2 u^*}{\partial x^{*2}} + \frac{\partial^2 u^*}{\partial y^{*2}} \right] \quad (7)$$

$$1 \frac{1}{1} + \delta^* \frac{1}{\delta^*} = O(1) + (\delta^{*2}) \left[\frac{1}{\delta^*} + \frac{1}{\delta^{*2}} \right]$$

$$u^* \frac{\partial v^*}{\partial x^*} + v^* \frac{\partial v^*}{\partial y^*} = -\frac{\partial p^*}{\partial y^*} + \frac{1}{Re} \left[\frac{\partial^2 v^*}{\partial x^{*2}} + \frac{\partial^2 v^*}{\partial y^{*2}} \right] \quad (8)$$

$$1 \frac{\delta^*}{1} + \delta^* \frac{\delta^*}{\delta^*} = \delta^* + (\delta^{*2}) \left[\frac{\delta^*}{\delta^*} + \frac{\delta^*}{\delta^{*2}} \right]$$

And the partial derivative is now replaced by total derivative simply because the variation in y direction is 0. The conclusion from this slide is each term in this equation is of order 1 therefore retained.

Each term in this equation is of order 1, the only term which is not is, this term the actual second derivative in actual direction and ignore each term in this equation is of order δ^* and of the order δ^* . Therefore, the equation as a whole is neglected.

(Refer Slide Time: 26:16)

BL Approximations L5($\frac{6}{15}$)

$$\begin{aligned} u^* &\gg v^* \\ \frac{\partial u^*}{\partial y^*} &\gg \frac{\partial u^*}{\partial x^*} + \frac{\partial v^*}{\partial x^*} + \frac{\partial v^*}{\partial y^*} \\ \frac{\partial^2 u^*}{\partial y^{*2}} &\gg \frac{\partial^2 u^*}{\partial x^{*2}} \\ \frac{\partial^2 v^*}{\partial y^{*2}} &\gg \frac{\partial^2 v^*}{\partial x^{*2}} \\ \frac{\partial p^*}{\partial y^*} &\approx O(\delta^*) \text{ negligible} \\ \frac{\partial p^*}{\partial x^*} &\approx O(1) = \frac{dp_w^*}{dx^*} = \frac{dp_w^*}{dx^{*0}} \end{aligned}$$

March 15, 2012 8:17

You will then see the boundary layer approximations that emerged. So, what does it say? It says that u^* will be much greater than v^* , which we had already postulated the gradient of velocity in a y direction.

The u velocity in y direction would be much greater than the gradient of velocity because would be one over δ^* , whereas this is one over one this is δ^* by one and this is δ^* by δ^* .

Therefore, this would dominate over all these. We already shown that the second derivative in y direction will be much greater than the second derivative in x direction both for u and v . We also shown that the pressure gradient in y direction would be almost negligible.

(Refer Slide Time: 27:21)

2D BL Equations L4($\frac{7}{15}$)

$$\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} = 0 \quad (9)$$

$$\rho \left[u \frac{\partial u}{\partial x} + v \frac{\partial u}{\partial y} \right] = -\frac{dp_\infty}{dx} + \mu \frac{\partial^2 u}{\partial y^2} \quad (10)$$

$$-\frac{dp_\infty}{dx} = \rho U_\infty \frac{dU_\infty}{dx} \quad U_\infty(x) \text{ specified} \quad (11)$$

local shear stress: $\tau_y = \mu \left\{ \frac{\partial u}{\partial y} \right\}_{y=0}$ (12)

average shear stress: $\bar{\tau} = \frac{1}{L} \int_0^L \mu \left\{ \frac{\partial u}{\partial y} \right\}_{y=0} dx$ (13)

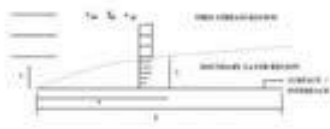

March 15, 2010 8/11

Therefore, the pressure gradient in x direction which is of the order 1 can be replaced by either the pressure gradient in the infinity state that is the free stream region or it can be evaluated at the wall state $dp_{star} wall dx star$. The reduced equations also called the Boundary layer equations are simply du by dx plus dv by dy equal to 0.

(Refer Slide Time: 27:48)

BL Concept L5($\frac{4}{15}$)

- The concept of the wall boundary layer was first introduced by L. Prandtl in 1904 to theoretically predict the **drag** experienced by a body immersed in a flowing fluid.
- Prandtl identified a thin viscosity affected region close to a surface in which **significant velocity variations** take place.
- Outside the Boundary Layer, **Free Stream is Inviscid**

Define

- $x^* = x/L, y^* = y/L$
- $u^* = u/U_\infty, v^* = v/U_\infty$
- $\rho^* = \rho/(\rho U_\infty^2), Re = \frac{\rho U_\infty L}{\mu}$
- $\delta \ll X, u \gg v$

L and U_∞ are reference length & velocity

March 15, 2010 8/11

ρ into $u du$ by dx plus $v du$ by dy equal to minus dp infinity by dx plus μd^2u by dy square. Now, just see for a moment, if you look at this figure you will see outside in the free stream region the velocity variation with respect to y is negligible or 0.

(Refer Slide Time: 28:04)

2D BL Equations L4(7/15)

$$\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} = 0 \quad (9)$$

$$\rho \left[u \frac{\partial u}{\partial x} + v \frac{\partial u}{\partial y} \right] = -\frac{dp_\infty}{dx} + \mu \frac{\partial^2 u}{\partial y^2} \quad (10)$$

$$-\frac{dp_\infty}{dx} = \rho U_\infty \frac{dU_\infty}{dx} \quad U_\infty(x) \text{ specified} \quad (11)$$

$$\text{local shear stress: } \tau_x = \mu \left\{ \frac{\partial u}{\partial y} \right\}_{y=0} \quad (12)$$

$$\text{average shear stress: } \bar{\tau} = \frac{1}{L} \int_0^L \mu \left\{ \frac{\partial u}{\partial y} \right\}_{y=0} dx \quad (13)$$

March 15, 2017 9/17

Because u remains equal to u_∞ outside the boundary layer. So, if I want to write this equation in the infinity state that is in the free stream region, I will have this will become $\rho u_\infty \frac{du_\infty}{dx}$ but this term would be 0 because $\frac{du_\infty}{dx} = 0$ and also $\frac{d^2u_\infty}{dy^2}$ is also 0, because this term vanishes in the free stream. The free stream region is sometimes called in viscous region because viscosity is not allowed to play any part.

The momentum equation written for the free stream region would simply be $-\frac{dp_\infty}{dx} = \rho u_\infty \frac{du_\infty}{dx}$ and in fact, I can replace that term by this term.

These equations must be solved with n boundary conditions because there is a second order derivative in y direction. Therefore, you need boundary condition at $y = 0$ which is $y = 0$ at wall and $y \rightarrow \infty$ which is the free stream condition.

If $u_\infty(x)$ is specified, one could readily replace that by this condition. When the equations are solved with appropriate boundary condition, you would have u as a function of x and y and v as a function of x and y as a solution because this term is specified have two equations and two unknowns u and v . These can be readily obtained and what you are interested is the shear stress at the wall, which is simply $\mu \frac{du}{dy}$ at $y = 0$ which is the local shear stress τ_x .

(Refer Slide Time: 30:12)

3D Energy Eqn L5(8/15)

$$\rho_m \frac{D h_m}{D t} = \frac{\partial}{\partial x_j} \left[k_m \frac{\partial T}{\partial x_j} \right] - \frac{\partial (\sum m_k h_k)}{\partial x_j} + \mu \Phi_v + \frac{D p}{D t} + \dot{Q}_{chem} + \dot{Q}_{rad} \quad (14)$$

where $h_m = \sum \omega_k h_k$ and $h_k = h_{f,k}^0(T_{ref}) + \int_{T_{ref}}^T C_{p,k} dT$

We again invoke **uniform property assumption**

March 15, 2010 10/17

The average shear stress which is given as $\frac{1}{L} \int_0^L \mu \frac{du}{dy} dy$ divided by $\frac{1}{L}$ will give you the total drag over a surface L of length L . So, we have finished our discussion on velocity boundary layer equation.

Now, we will turn our attention to energy equation and you will recall the energy equation that we wrote on the last slide of the previous lecture. So, this is the rate of generation of rate of change of enthalpy plus conduction heat transfer first diffusion heat transfer the heat transfer due to mass diffusion.

This is the viscous dissipation, this is the pressure work terms and these are the chemical energy and this is the radiation, h_m as you know is $\sum \omega_k h_k$, where h_k is the specific enthalpy of species k and h_k is also given as heat of formation at sometimes at T_{ref} plus sensible heat $C_{p,k} dT$.

(Refer Slide Time: 31:14)

Dimensionless 2D Energy Eqn L5($\frac{9}{15}$)

$$\begin{aligned}
 & \left(u^* \frac{\partial T^*}{\partial x^*} + v^* \frac{\partial T^*}{\partial y^*} \right) \\
 &= \left(\frac{1}{Re Pr} \right) \left[\frac{\partial^2 T^*}{\partial x^{*2}} + \frac{\partial^2 T^*}{\partial y^{*2}} \right] \\
 &+ (Ec) \left\{ u^* \frac{\partial p^*}{\partial x^*} + v^* \frac{\partial p^*}{\partial y^*} \right\} + \dot{Q}_{chem}^* + \dot{Q}_{rad}^* \\
 &+ \left(\frac{Ec}{Re} \right) \left[2 \left(\frac{\partial u^*}{\partial x^*} \right)^2 + 2 \left(\frac{\partial v^*}{\partial y^*} \right)^2 + \left(\frac{\partial u^*}{\partial y^*} + \frac{\partial v^*}{\partial x^*} \right)^2 \right] \quad (15)
 \end{aligned}$$

- 1 $T^* = (T - T_{\infty}) / \Delta T_0 \rightarrow O(1)$
- 2 $Pr = \text{Prandtl Number} = \mu Cp / k = \nu / \alpha$
- 3 $Ec = \text{Eckert Number} = U_{\infty}^2 / Cp \Delta T_0$
- 4 $\dot{Q}^* = \dot{Q} L / (\rho_m Cp_m U_{\infty})$

March 16, 2010 11:13

(Refer Slide Time: 31:20)

3D Energy Eqn L5($\frac{8}{15}$)

$$\begin{aligned}
 \rho_m \frac{D h_m}{D t} &= \frac{\partial}{\partial x_j} \left[k_m \frac{\partial T}{\partial x_j} \right] - \frac{\partial (\sum m_{j,k}^* h_k)}{\partial x_j} + \mu \Phi_v \\
 &+ \frac{D p}{D t} + \dot{Q}_{chem} + \dot{Q}_{rad} \quad (14)
 \end{aligned}$$

where $h_m = \sum \omega_k h_k$ and $h_k = h_{f,k}^0 (T_{ref}) + \int_{T_{ref}}^T Cp_k dT$

We again invoke **uniform property assumption**

March 16, 2010 10:13

We again invoke uniform property assumption in 2 dimensions. The equation would read something like that; let me go back a little so the first equation would read in 2 dimensions.

(Refer Slide Time: 31:27)

Handwritten equations on a whiteboard:

$$\rho_m \left[u \frac{\partial h_m}{\partial x} + v \frac{\partial h_m}{\partial y} \right] = k \left[\frac{\partial^2 T}{\partial x^2} + \frac{\partial^2 T}{\partial y^2} \right] + \mu \left[2 \left(\frac{\partial u}{\partial x} \right)^2 + 2 \left(\frac{\partial v}{\partial y} \right)^2 + \left(\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} \right)^2 \right] + \frac{\partial p}{\partial t} + u \frac{\partial p}{\partial x} + v \frac{\partial p}{\partial y} + Q_{chem} + Q_{rad}$$

$$h_{p,k} = h_{f,k} + c_{p,m} (T - T_{ref}) \quad c_{p,k} = c_{p,m}$$

$$h_m = \sum \omega_k h_{f,k} = \sum \omega_k h_{f,k} + c_{p,m} (T - T_{ref}) \quad \sum \omega_k = 1$$

$$h_m = \Delta h_c + c_{p,m} (T - T_{ref})$$

$$h_m = c_{p,m} (T - T_{ref})$$

It would read rho m dhm by dt plus rho m into u dhm by dx plus v dhm by dy equal to and with uniform property d2t dx square plus d2t dy square plus d by dx of sum 1k h k minus d by dy of sigma m naught 2k h k plus mu times 2 into du by dx square

(Refer Slide Time: 33:11)

Dimensionless 2D Energy Eqn L5(9/15)

$$\left(u^* \frac{\partial T^*}{\partial x^*} + v^* \frac{\partial T^*}{\partial y^*} \right) = \frac{1}{Re Pr} \left[\frac{\partial^2 T^*}{\partial x^{*2}} + \frac{\partial^2 T^*}{\partial y^{*2}} \right] + (Ec) \left\{ u^* \frac{\partial p^*}{\partial x^*} + v^* \frac{\partial p^*}{\partial y^*} \right\} + Q_{chem}^* + Q_{rad}^* + \frac{Ec}{Re} \left[2 \left(\frac{\partial u^*}{\partial x^*} \right)^2 + 2 \left(\frac{\partial v^*}{\partial y^*} \right)^2 + \left(\frac{\partial u^*}{\partial y^*} + \frac{\partial v^*}{\partial x^*} \right)^2 \right] \quad (15)$$

- $T^* = (T - T_{\infty}) / \Delta T_0 \rightarrow O(1)$
- $Pr = \text{Prandtl Number} = \mu Cp / k = \nu / \alpha$
- $Ec = \text{Eckert Number} = U_{\infty}^2 / Cp \Delta T_0$
- $Q^* = \dot{Q} L / (\rho_m Cp_m U_{\infty})$

plus 2 times dv by dy square plus dp by dt plus u dp by dx plus v dp by dy plus Q dot chem plus Q dot rad. So, you will see in 2 dimensions the equation takes this form and now, if I first of all make all our assumptions that the flow is steady therefore that is 0.

h_m which is h naught f h k which is h naught f k and $C_p k$ equal to $C_p m$ then $C_p m$ T minus T_{ref} because all spaces have the same property of the mixture and therefore $C_p k$ is equal to $C_p m$.

It is a uniform mixture you have k times d^2T/dT^2 square and if I ignore for the time being the **diffusion equation the diffusion heat transfer** for a single phase flow non reacting flow then or absorb that in this.

Then you will see I get terms like this. Now, I am going to non **dimensionalize** these terms. This as the whole can $\sigma \omega k h k$, which is h_m would become $\sigma \omega k h$ naught f k plus $C_p m$ T minus T_{ref} into $\sigma \omega k$ and which you know is equal to 1.

So, you get that term $\sigma \omega k h$ naught f k and that is equal to heat of combustion plus $C_p m$ T minus T_{ref} and these term essentially is accounted by the chemical reaction and I can replace h_m here for is non reacting flow $C_p m$ T minus T_{ref} .

(Refer Slide Time: 35:31)

Handwritten mathematical derivation on a whiteboard:

$$T^* = \frac{T - T_0}{\Delta T_0}$$

$$\frac{\rho_m C_{pm} \Delta T_0 U_0}{L} \left[u^* \frac{\partial T^*}{\partial x^*} + v^* \frac{\partial T^*}{\partial y^*} \right]$$

$$= \frac{k \Delta T_0}{L^2} \left[\frac{\partial^2 T^*}{\partial x^{*2}} + \frac{\partial^2 T^*}{\partial y^{*2}} \right]$$

$$+ \frac{\mu U_0^2}{L^2} \left[2 \left(\frac{\partial u^*}{\partial x^*} \right)^2 + 2 \left(\frac{\partial v^*}{\partial y^*} \right)^2 + \left(\frac{\partial u^*}{\partial x^*} \frac{\partial v^*}{\partial y^*} \right)^2 \right]$$

On the left side of the whiteboard, there is a note: $C_{pm} = 1$ and μ/k .

(Refer Slide Time: 35:45)

Handwritten mathematical derivation on a whiteboard showing the derivation of the energy balance equation for a fluid element. The equations include terms for kinetic energy, potential energy, and enthalpy, leading to the final form: $\sum w_k h_k = \sum w_k h_k^0 + c_{pm}(T - T_{ref})$.

What I am done now is, I have said define T^* equal to $T - T_{\infty}$ divided by some reference temperature difference. Then, you will see that this term would simply become $\rho_m C_{p,m} \int U dT$ by dx plus $v dt$ by dy .

If I have to non-dimensionalize the first term here, it would read as $\rho_m C_{p,m} \Delta T_{naught}$ divided by L u_{∞} equal to $u^* dT^*$ by dx^* plus $v^* dT^*$ by dy^* square and that would equal k times ΔT_{naught} divided by L square $d^2 T^*$ by dx^* square plus $d^2 T^*$ by dy^* square plus μ times u_{∞} square divided by L square 2 times du^* by dx^* whole square plus 2 times dv^* by dy^* whole square

(Refer Slide Time: 37:32)

Dimensionless 2D Energy Eqn L5($\frac{9}{15}$)

$$\begin{aligned}
 & \left(u^* \frac{\partial T^*}{\partial x^*} + v^* \frac{\partial T^*}{\partial y^*} \right) \\
 &= \left(\frac{1}{Re Pr} \right) \left[\frac{\partial^2 T^*}{\partial x^{*2}} + \frac{\partial^2 T^*}{\partial y^{*2}} \right] \\
 &+ (Ec Pr) \left\{ u^* \frac{\partial p^*}{\partial x^*} + v^* \frac{\partial p^*}{\partial y^*} \right\} + \dot{Q}_{chem}^* + \dot{Q}_{rad}^* \\
 &+ \left(\frac{Ec}{Re} \right) \left[2 \left(\frac{\partial u^*}{\partial x^*} \right)^2 + 2 \left(\frac{\partial v^*}{\partial y^*} \right)^2 + \left(\frac{\partial u^*}{\partial y^*} + \frac{\partial v^*}{\partial x^*} \right)^2 \right] \quad (15)
 \end{aligned}$$

- 1 $T^* = (T - T_\infty) / \Delta T_0 \rightarrow O(1)$
- 2 $Pr = \text{Prandtl Number} = \mu Cp / k = \nu / \alpha$
- 3 $Ec = \text{Eckert Number} = U_\infty^2 / Cp \Delta T_0$
- 4 $\dot{Q}^* = \dot{Q} L / (\rho_m Cp_m U_\infty)$

March 15, 2010 11/07

(Refer Slide Time: 37:41)

Handwritten derivation showing the simplification of the energy equation:

$$\begin{aligned}
 & \left(\frac{\rho_m Cp_m \Delta T_0 U_\infty}{L^2} \right) \left(u \frac{\partial T}{\partial x} + v \frac{\partial T}{\partial y} \right) \\
 &= \frac{k \Delta T_0}{L^2} \times \frac{L}{\rho_m Cp_m \Delta T_0 U_\infty} \\
 &= \frac{\alpha}{L U_\infty} \\
 &= \frac{\alpha}{\nu} \frac{\nu}{L U_\infty} \\
 &= \frac{1}{Re}
 \end{aligned}$$

plus $u^* \frac{\partial T^*}{\partial x^*}$ plus $v^* \frac{\partial T^*}{\partial y^*}$ whole square and so on. So, that is what you see here the terms are written like that. Now, if I divide through by this quantity you will readily see that, I will get $u^* \frac{\partial T^*}{\partial x^*} + v^* \frac{\partial T^*}{\partial y^*}$ equal to $k \Delta T_0$ by L^2 into ρ_m into L divided by $\rho_m Cp_m \Delta T_0 U_\infty$. So, you will see ΔT_0 gets cancelled with ΔT_0 L gets cancelled with one of these L 's and k divided by $\rho_m Cp_m k_m$. You will be simply the thermal diffusivity α divided by L into U_∞ , which I can also write

as alpha m divided by nu m nu m divided by LU infinity and that is nothing but 1 over Prandtl number into 1 over Schmidt number and that is what you see I mean one over Reynolds number beg your pardon

(Refer Slide Time: 38:50)

Dimensionless 2D Energy Eqn L5($\frac{9}{15}$)

$$\begin{aligned}
 & \left(u^* \frac{\partial T^*}{\partial x^*} + v^* \frac{\partial T^*}{\partial y^*} \right) \\
 &= \left(\frac{1}{Re Pr} \right) \left[\frac{\partial^2 T^*}{\partial x^{*2}} + \frac{\partial^2 T^*}{\partial y^{*2}} \right] \\
 &+ (Ec) \left\{ u^* \frac{\partial p^*}{\partial x^*} + v^* \frac{\partial p^*}{\partial y^*} \right\} + \dot{Q}_{chem}^* + \dot{Q}_{rad}^* \\
 &+ \left(\frac{Ec}{Re} \right) \left[2 \left(\frac{\partial u^*}{\partial x^*} \right)^2 + 2 \left(\frac{\partial v^*}{\partial y^*} \right)^2 + \left(\frac{\partial u^*}{\partial y^*} + \frac{\partial v^*}{\partial x^*} \right)^2 \right] \quad (15)
 \end{aligned}$$

- $T^* = (T - T_\infty) / \Delta T_o \rightarrow O(1)$
- $Pr = \text{Prandtl Number} = \mu C_p / k = \nu / \alpha$
- $Ec = \text{Eckert Number} = U_\infty^2 / C_p \Delta T_o$
- $\dot{Q}^* = \dot{Q} L / (\rho_m C_p U_\infty)$

That is what you see here, the multiplier of $\frac{\partial^2 T^*}{\partial x^{*2}} + \frac{\partial^2 T^*}{\partial y^{*2}}$ would simply become 1 over Reynolds Prandtl. The third term, the pressure work term, the viscous dissipation term is somewhat important.

(Refer Slide Time: 39:19)

$T^* = T - T_o$

$$\frac{\mu U_\infty^2}{k L} \cdot \frac{k}{\rho_m C_p \Delta T_o U_\infty}$$

$$\frac{U_\infty^2}{C_p \Delta T_o} \cdot \frac{\mu}{\rho_m U_\infty L} \Bigg| \frac{Ec}{Re} = \frac{U_\infty^2}{C_p \Delta T_o}$$

$$\begin{aligned}
 U_\infty^2 &= \frac{m^2}{s^2} \\
 C_p \Delta T_o &= \frac{J}{kg \cdot K} \cdot K \\
 &= \frac{J}{kg} = \frac{N \cdot m}{kg} = \frac{kg \cdot m / s^2 \cdot m}{kg} \\
 &= \frac{m^2}{s^2}
 \end{aligned}$$

In the sense that you will see now that if I have to divide through again. Then, you will see that μu_{∞}^2 divided by L^2 divided by $1/\rho m C_p \Delta T_{\infty}$ into L .

Now, you will see this becomes equal to u_{∞}^2 divided by $C_p \Delta T_{\infty}$. I have taken care of that term and this term then I have μ times $\rho m U_{\infty} L$ and therefore this is nothing but $1/\text{Reynolds number}$.

This term is dimensionless as we can see u_{∞}^2 is meter square per Second Square. What about this term $C_p \Delta T_{\infty}$, C_p is joules per kg kelvin multiplied by Kelvin. So, essentially it is joules per kg.

Joule is Newton meter by kg. Newton is kg into meters per Second Square into meter divided by kg. So, kg kg gets cancelled and you again get meter square per Second Square. Remember, $C_p \Delta T_{\infty}$ and u_{∞}^2 both have same units and therefore this is a dimensionless quantity.

Professor Eckert defined a quantity u_{∞}^2 by 2, which is the kinetic energy divided by $C_p \Delta T_{\infty}$, which is the sensible energy as Eckert number Ec . Ec is called the Eckert number Ec and therefore you will see that it is at the moment U_{∞}^2 by 2.

(Refer Slide Time: 41:45)

Dimensionless 2D Energy Eqn L5($\frac{9}{15}$)

$$\begin{aligned}
 & (u^* \frac{\partial T^*}{\partial x^*} + v^* \frac{\partial T^*}{\partial y^*}) \\
 &= \left(\frac{1}{Re Pr} \right) \left[\frac{\partial^2 T^*}{\partial x^{*2}} + \frac{\partial^2 T^*}{\partial y^{*2}} \right] \\
 &+ (Ec) \left\{ u^* \frac{\partial p^*}{\partial x^*} + v^* \frac{\partial p^*}{\partial y^*} \right\} + \dot{Q}_{chem}^* + \dot{Q}_{rad}^* \\
 &+ \left(\frac{Ec}{Re} \right) \left[2 \left(\frac{\partial u^*}{\partial x^*} \right)^2 + 2 \left(\frac{\partial v^*}{\partial y^*} \right)^2 + \left(\frac{\partial u^*}{\partial y^*} + \frac{\partial v^*}{\partial x^*} \right)^2 \right] \quad (15)
 \end{aligned}$$

- $T^* = (T - T_{\infty})/\Delta T_o \rightarrow O(1)$
- $Pr = \text{Prandtl Number} = \mu C_p / k = \nu/\alpha$
- $Ec = \text{Eckert Number} = U_{\infty}^2 / C_p \Delta T_o$
- $\dot{Q}^* = \dot{Q} L / (\rho m C_p U_{\infty})$

March 10, 2010 11:18

So, you get here Eckert number divided by Reynolds into all that. What about the pressure gradient terms? Here you will see only a multiplier E_c . In other words, the dimensionless equation tells us that, there are now three parameters associated with heat transfer.

One is the Prandtl number, the other one is the Reynolds number and the third one is Eckert number. We can readily see, if the Eckert number was large both these terms will be important. If the Reynolds number is high and Eckert number is small then we can ignore these two term.

The pressure work term and the viscous dissipation term. So, with this equation I can do order of magnitude analysis because it is now in dimensionless form. So, what is the order of magnitude analysis that I do?

(Refer Slide Time: 42:48)

$LHS = u^* \frac{\partial T^*}{\partial x^*} + v^* \frac{\partial T^*}{\partial y^*}$
 $= 1 \frac{1}{1} + \delta^* \frac{1}{\delta^{*2}}$
 $RHS = \frac{1}{Re Pr} \left[\frac{1}{1} + \frac{1}{\delta^{*2}} \right] + \frac{\frac{\partial T^*}{\partial x^*} \frac{\partial T^*}{\partial x^*}}{2 Re Pr} + \frac{\frac{\partial T^*}{\partial y^*} \frac{\partial T^*}{\partial y^*}}{2 Pr}$
 $Pr = \frac{\mu Cp}{k} = \frac{\mu/\rho}{(k/\rho Cp)}$
 $= \frac{\nu}{\alpha} = \frac{\text{Kinematic Vis}}{\text{Thermal Diff}}$

So, the left hand side which is equal to $u^* \frac{\partial T^*}{\partial x^*} + v^* \frac{\partial T^*}{\partial y^*}$ will simply become $1 + \delta^* \frac{1}{\delta^{*2}}$. So, both the terms on the left hand side are important.

Right hand side remember this is $\frac{1}{Re Pr} \left[\frac{1}{1} + \frac{1}{\delta^{*2}} \right] + \frac{\frac{\partial T^*}{\partial x^*} \frac{\partial T^*}{\partial x^*}}{2 Re Pr} + \frac{\frac{\partial T^*}{\partial y^*} \frac{\partial T^*}{\partial y^*}}{2 Pr}$ therefore that term would be $\frac{d^2 T^*}{dx^{*2}}$ will be much smaller than $\frac{d^2 T^*}{dy^{*2}}$.

(Refer Slide Time: 43:52)

Dimensionless 2D Energy Eqn L5($\frac{9}{15}$)

$$\begin{aligned}
 & (u^* \frac{\partial T^*}{\partial x^*} + v^* \frac{\partial T^*}{\partial y^*}) \\
 &= \left(\frac{1}{Re Pr} \right) \left[\frac{\partial^2 T^*}{\partial x^{*2}} + \frac{\partial^2 T^*}{\partial y^{*2}} \right] \\
 &+ \infty (Ec) \left\{ u^* \frac{\partial p^*}{\partial x^*} + v^* \frac{\partial p^*}{\partial y^*} \right\} + \dot{Q}_{chem}^* + \dot{Q}_{rad}^* \\
 &+ \left(\frac{Ec}{Re} \right) \left[2 \left(\frac{\partial u^*}{\partial x^*} \right)^2 + 2 \left(\frac{\partial v^*}{\partial y^*} \right)^2 + \left(\frac{\partial u^*}{\partial y^*} + \frac{\partial v^*}{\partial x^*} \right)^2 \right] \quad (15)
 \end{aligned}$$

- 1 $T^* = (T - T_{\infty}) / \Delta T_0 \rightarrow O(1)$
- 2 $Pr = \text{Prandtl Number} = \mu C_p / k = \nu / \alpha$
- 3 $Ec = \text{Eckert Number} = U_{\infty}^2 / C_p \Delta T_0$
- 4 $\dot{Q}^* = \dot{Q} L / (\rho_m C_p U_{\infty})$

(Refer Slide Time: 43:57)

Energy Equation - B L Form L5($\frac{10}{15}$)

Carrying out Order-of-Magnitude analysis, and invoking B L approximations, we have

$$\rho C_p \left[u \frac{\partial T}{\partial x} + v \frac{\partial T}{\partial y} \right] = k \frac{\partial^2 T}{\partial y^2} + \mu \left(\frac{\partial u}{\partial y} \right)^2 + u \frac{dp_{\infty}}{dx} + \dot{Q}_{chem} + \dot{Q}_{rad} \quad (16)$$

- 1 Note that $\partial^2 T^* / \partial y^{*2} \gg \partial^2 T^* / \partial x^{*2}$
- 2 In the viscous dissipation term, only $(\partial u^* / \partial y^*)^2$ is important.
- 3 In the pressure work terms, $u dp_{\infty} / dx$ is important

So, if you follow through in this manner you can carry out that order of magnitude analysis and the resulting equation would be simply this rho Cp u dT by dx plus v dT by dy equal to diffusion only in y direction plus viscous dissipation due to velocity gradient in y direction plus u d infinity by dx plus Q dot chem plus Q dot rad.

(Refer Slide Time: 44:22)

This is the boundary layer form of the energy equation. A note on Prandtl number. Prandtl number as you know is the ratio of $C_p \mu / k$, which is also if I divide both the numerator and denominator by ρ than it is μ / ρ divided by $k / \rho C_p$ and that is equal to ν divided by α or kinematic viscosity divided by thermal diffusivity.

It is in a way the ratio of the rate at which momentum is transferred divided by the rate at which heat is transferred. In boundary layers, this diffusion is taking place only across the boundary layer.

Then, you also notice that Prandtl number is the property of the fluid. It has nothing to do with the flow and therefore we can classify fluids according to their Prandtl numbers. Close to one and little below say from about 0.5 to 1, you usually get gases, but 3 to 10 or little over 10 is water but if you extend that to about 100 you will get many organic liquids included in this range. If the Prandtl number is much greater than 100, then usually you will encounter very viscous oils because Prandtl number has viscosity in the numerator. Usually, oils have a very large Prandtl numbers. On the other hand, liquid metals like mercury, sodium, liquid potassium, which are used for high heat flux heat transfers as obtained in for example breeder reactors liquid metals are preferred.

In those cases, their conductivities are so high compared to their viscosity that liquid metals have very low Prandtl number. There are not many fluids in this range.

But from about let us say 5 or into 10 is to minus 3 to below, you essentially get liquid metals. So, you have liquid metal range is very low Prandtl number gases very close to unity Prandtl number.

Mass Transfer Eqn L5($\frac{12}{15}$)

3D Mass Transfer Equation

$$\frac{\partial(\rho_m \omega_k)}{\partial t} + \frac{\partial(\rho_m u_j \omega_k)}{\partial x_j} = \frac{\partial}{\partial x_j} (\rho_m D \frac{\partial \omega_k}{\partial x_j}) + R_k \quad (17)$$

Carrying out Order-of-Magnitude analysis, invoking B L approximations, and making uniform property assumptions, we have

2D Mass Transfer B L Equation

$$\rho_m \left[u \frac{\partial \omega_k}{\partial x} + v \frac{\partial \omega_k}{\partial y} \right] = \rho_m D \frac{\partial^2 \omega_k}{\partial y^2} + R_k \quad (18)$$

March 16, 2010 14/17

Water and organic liquids between 3 and about 100 and oils much greater than 100. The mass transfer equation can likewise be derived I am wont going to the details and it reads in like this.

(Refer Slide Time: 47:27)

Dimensionless Form L5($\frac{13}{15}$)

$$\left[u^* \frac{\partial \omega_k^*}{\partial x^*} + v^* \frac{\partial \omega_k^*}{\partial y^*} \right] = \left(\frac{1}{Re Sc} \right) \frac{\partial^2 \omega_k^*}{\partial y^{*2}} + R_k^* \quad (19)$$

- 1 $\omega^* = (\omega - \omega_\infty) / \Delta \omega_0 \rightarrow O(1)$
- 2 $Sc = \text{Schmidt Number} = \nu / D$
- 3 $R_k^* = R_k L / (\rho_m U_\infty \Delta \omega_0)$

March 16, 2010 15/17

(Refer Slide Time: 47:37)

Summary L5(14/15)

$$\frac{\partial(\rho u \Phi)}{\partial x} + \frac{\partial(\rho v \Phi)}{\partial y} = \frac{\partial}{\partial y} \left[\Gamma_{\Phi} \frac{\partial \Phi}{\partial y} \right] + S_{\Phi} \quad (20)$$

Φ	Γ_{Φ}	S_{Φ}
1	0	0
u	μ_m	$-dp_{\infty}/dx$
T	k_m/Cp_m	$(\dot{Q}_{chem} + \dot{Q}_{rad} + \mu_m (\partial u/\partial y)^2 + u dp_{\infty}/dx)/Cp_m$
ω_k	$\mu_m D$	R_k

Recall: $a \Phi_{xx} + 2b \Phi_{xy} + c \Phi_{yy} = S(\Phi_x, \Phi_y, \Phi, x, y)$.
 When the discriminant $b^2 - ac = 0$, the equation is parabolic.
 When $b^2 - ac < 0$, the equation is elliptic.
 When $b^2 - ac > 0$, the equation is hyperbolic.

It can be non dimensionalised and instead of Prandtl number you will have a Schmidt number. We will take up all this, when we come to mass transfer. Therefore, I can summarize now what we did in this lecture.

We started with the derived 3 dimensional forms of the equations of bulk mass transfer momentum and energy and reduce them to the boundary layer form which contains two convection terms.

One diffusion term in y direction and one source term. It is good to get used to this form of generalization of the equations, you will see for phi equal to 1 you will simply have $\rho U dx + \rho v dy$.

And that term would be 0 and S_{Φ} is 0 it is essentially the mass conservation equation for u phi equal to u, you will see that this term is simply the viscosity and this term is $\mu dp_{\infty}/dx$.

For temperature, this term can be taken for phi equal to temperature this term can be taken as k_m/Cp_m and all the right hand side will be divided by Cp_m and for species k this.

Now, you will recall from your undergraduate studies that any 2 dimension on differential equation written in the form $a \Phi_{xx} + 2b \Phi_{xy} + c \Phi_{yy} = S(\Phi_x, \Phi_y, \Phi, x, y)$

yy equal to sum source term right hand side which may contain gradients of phi in so on and so forth.

Then, the discriminant $b^2 - 4ac$; if it is 0, then the equation is called parabolic. If $b^2 - 4ac$ is less than 0 the equation is elliptic and $b^2 - 4ac$ is greater than 0, then the equation is hyperbolic.

Of course, we are going to assume that γ is constant because we are dealing with uniform property. So, we have only $\frac{d^2 \phi}{dy^2}$ term that means c is finite, but in our equation a and b are 0 and discriminant $b^2 - 4ac$ is actually 0.

(Refer Slide Time: 50:00)

Methods of Solution L5(15/15)

Boundary Layer Equations are PARABOLIC

There are 3 Methods of Solution

- 1 Similarity Method (PDE to ODE)
- 2 Integral Method (PDE to ODE)
- 3 Finite-Difference or Finite Element Method (PDE to Set of Algebraic Equations)

March 16, 2010 11 / 31

Therefore, our boundary layer equations are parabolic and for such parabolic equation there are 3 methods of solution - the first one is called the Similarity method in which the partial differential equations are converted to ODE's Ordinary differential equation integral method. Similarly, the numerical method finite difference of finite element. We will take up these methods in the next lecture.
