Lecture - 38
Boundary Interpolating Patches

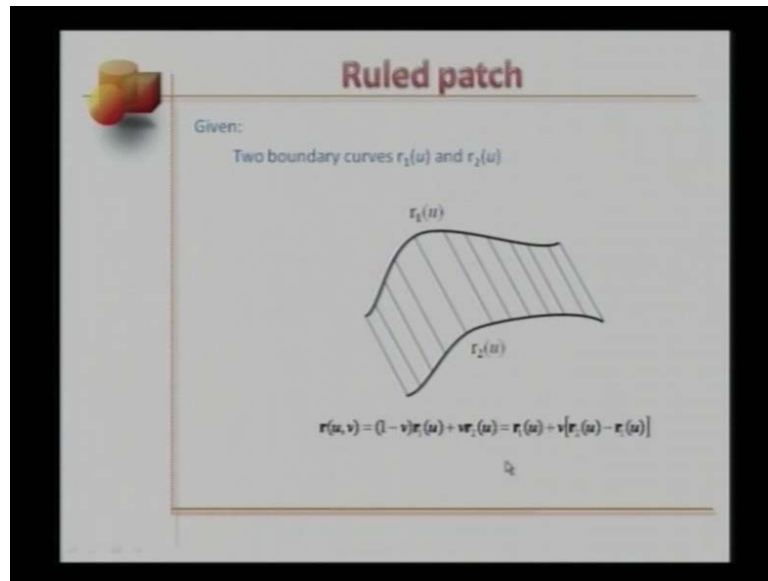

Good morning, today we move further. In lecture number 38, we discuss a new model of surface patches namely Boundary Interpolating Patches.

(Refer Slide Time: 00:35)

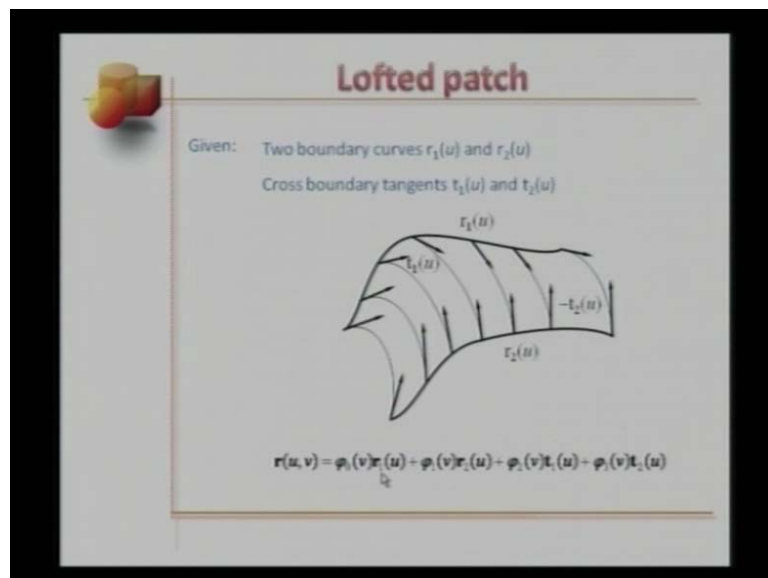

Here, you are going to be working with only boundary curves. So, given boundary curves, interpolate between them to achieve boundary interpolating patches this is what, the idea is. One can have 2, 3 or 4 boundary curves, as you would have observed in case of Bezier patches of these pan patches, the boundary curves in those cases or Bezier or Bezie plane curves themselves. So, in a way, the tensor product patches and the boundary interpolating patches are interrelated. One can also have slope information and the boundary curves or what we call, cross boundary tangent, I tell you in a little while, what I mean by them.

(Refer Slide Time: 01:47)

The first model ruled patch so, given two boundary curves r_1 of u and r_2 of u , this is the first curve, this is the second curve, r_1 of u and r_2 of u . One can perform linear interpolation between two corresponding points on the respective curves like so, it is like sketching or drawing different straight lines, joining two corresponding points of these two curves. Mathematically, a ruled patch can be expressed as, r as a function of u and v equals 1 minus v times r_1 of u plus v times r_2 of u .

(Refer Slide Time: 04:02)

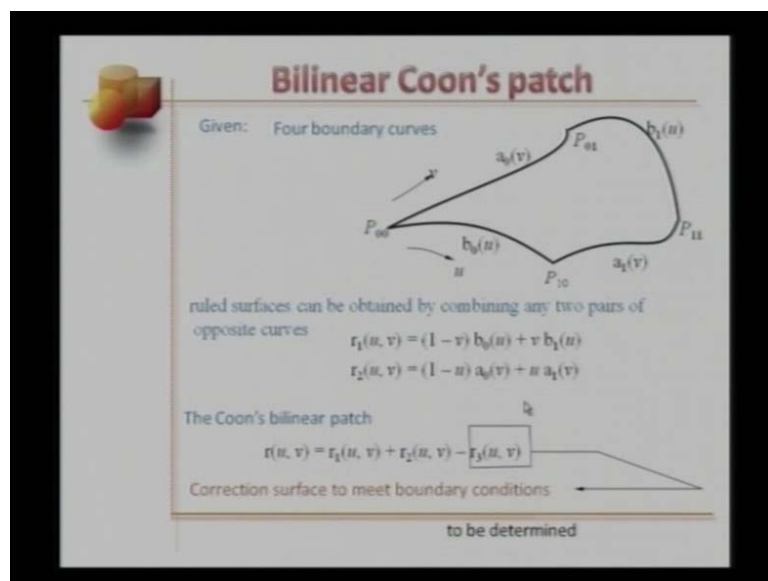

So, these are the u parametric representations, these are the v parametric representations

so, you can notice, it is a linear interpolation model. We can rewrite these expressions as, r_1 of u plus v times r_2 of u minus r_1 of u , this vector here gives some sense of the tangent information between the two curve models r_2 of u minus r_1 of u . The second model lofted patch, given, again two boundary curves r_1 of u and r_2 of u and also given additional information but any two cross boundary tangents t_1 of u and t_2 of u . For example, these are the two curves r_1 of u and r_2 of u , and we have these as cross boundary tangents, denoted by t_1 of u and t_2 of u , the directions shown here are opposite.

What we can do is, for any value of u , we can choose a corresponding point on this curve a corresponding point on this curve and loft a curve using these two corresponding tangents like so. And that is the basic difference between a ruled patch model and a lofted patch model, in a ruled patch model, we simply joint the corresponding points by a straight line but here, we use a higher order curve in this case, cubic to create the lofted effect.

Mathematically, a lofted patch can be written as, r of u v equals π_0 of v r_1 of u plus π_1 of v r_2 of u plus π_2 of v t_1 of u plus π_3 of v t_2 of u . r_1 , r_2 , t_1 and t_2 are given to us, any guess, as to what π_0 , π_1 , π_2 and π_3 all as functions of v can be. You are right, these are the Hermite polynomials, the Hermite cubic polynomial, that we had seen in case of (()).

(Refer Slide Time: 06:58)

The next model bilinear coons patch, given, four boundary curves, in all the previous

model, we had considered two boundary curves and in the lofted patch, we had also considered cross boundary tangents at those two curves. But here, we work with four boundary curves of those, this is the first one, this is the second one, this boundary curve here is denoted by b_0 function of u , b_1 function of u .

We have two more, these are denoted by a_0 as v and a_1 as a function of v , this is the u parametric direction and that is the v parametric direction. There will be four points of intersection, the first one is represented as P_{00} , this was first found for values of u and v , both are 0. This is P_{10} , for u equals 1 v equal 0, P_{11} , for u and v equals 1 and P_{01} , for u equals 0 and v equals 1. Here, we do not have any additional information so that, probably, using ruled surface models, we can obtain them by combining any two pairs of opposite curves.

For example, we can combine these two curves or combine; these two curve let us say, the first ruled patch model r_1 of $u v$ is given by a linear combination of $b_0(u)$ and $b_1(u)$, this model and this curve model $1 - v$ times $v_0 u$ plus v times b_1 of u . Likewise, you can have another rule patch, $r_2 u v$ equals $1 - u$ times $a_0 v$ plus u times $a_1 v$.

(Refer Slide Time: 11:23)

Once again, we have a rule patch by combining these two models and we have another rule patch r_2 , by combining these two opposite curves. The coon's bilinear patch can be obtained by adding r_1 and r_2 , $r u v$ equals $r_1 u v$ plus $r_2 u v$ or wait a minute, why are

we subtracting $r_3 u v$. We do not know anything about it, we will probably have to make this adjustment to make sure, that all the boundary conditions are met. So, r_3 of u and v is like a correction surface, to ensure the boundary conditions are properly addressed, we need to determine r_3 and we will do this next.

So, the correction surface, how do we determine this so, this is the previous picture of bilinear coon's patch, I have copied for expressions for r_1 here and r_2 here. Now, let us take a look at some of the boundary conditions to determine r_3 , remember that, r is r_1 plus r_2 minus r_3 . Now, $r u 0$ is 1, corresponding to values of v equal 0, $r u 0$ is the curve $v 0 u$, which is equal to $r_1 u 0$ plus $r_2 u 0$ minus $r_3 u 0$, from the coon's patch model itself.

Now, look at, what $r_1 u 0$ can be, we should plug in v equals 0 here, this expression will be 0 and this will simply be $b_{sub 0}$ of u . So, $r_1 u 0$ is b_0 of u plus 1 minus u , $a_{0 0}$ plus $u a_{1 0}$ these two terms come from here, if you plug in v equals 0, we have 1 minus $u a_{0 0}$ plus $u a_{1 0}$ minus r_3 of $u 1 0$. If you look at $a_{0 0}$ of 0, we are here on this curve and for a value v equal 0, we are here on this point $P_{sub 0 0}$, which is what this is.

Likewise, if you look at $a_{1 0}$ of 0, we are on this curve and for v equals 0, we are on this point $P_{1 0}$, which is this here. So, we consider the right hand side and the left hand side, $v 0$ of u would cancel out and eventually, will have $r_3 u 0$ equals 1 minus $u P_{0 0}$ plus u times $P_{1 0}$. Let us say, this result, let us proceed further bilinear coon's patch, you are now looking at $r u 1$, $r u 1$ will be $r_1 u 1$ plus $r_2 u 1$ minus $r_3 u 1$.

For value of v equals 1, what is the surface $r u 1$, this is this curve here, this bounding curve b_1 of u now, plug in the value of v equals 1 here and v equals 1 here, what do you get. For v equals 1, we get b_1 of u from $r_1 u v$ and for v equals 1, we get $a_{0 1}$ $a_{1 1}$ from $r_2 u v$ so, the right hand side can be solved as b_1 of u plus 1 minus u times $a_{0 1}$ plus $u a_{1 1}$ minus $r_3 u 1$. The $(()) a_{0 1}$ for v equals 1 is, we are on this curve for v equals 1, we are at point $P_{0 1}$, which is this. What is $a_{1 1}$ for v equals 1, we are here for v equals 1, we are at point $P_{1 1}$, with this right hand side, with this as left hand side, the one of u cancels out.

(Refer Slide Time: 16:31)

Correction surface $r_3(u, v)$

$$b_1(u) = r_1(u, 1) + r_2(u, 1) - r_3(u, 1)$$

$$= b_1(u) + (1-u)a_0(1) + u a_1(1) - r_3(u, 1)$$

$$= b_1(u) + (1-u)P_{01} + u P_{11} - r_3(u, 1)$$

$$\Rightarrow r_3(u, 1) = (1-u)P_{01} + uP_{11}$$

$$r_1(u, v) = (1-v)b_0(u) + v b_1(u)$$

$$r_2(u, v) = (1-u)a_0(v) + u a_1(v)$$

(Refer Slide Time: 16:44)

Correction surface $r_3(u, v)$

$$r_3(u, 0) = (1-u)P_{00} + uP_{10}$$

$$r_3(u, 1) = (1-u)P_{01} + uP_{11}$$

Linearly blend $r_3(u, 0)$ and $r_3(u, 1)$

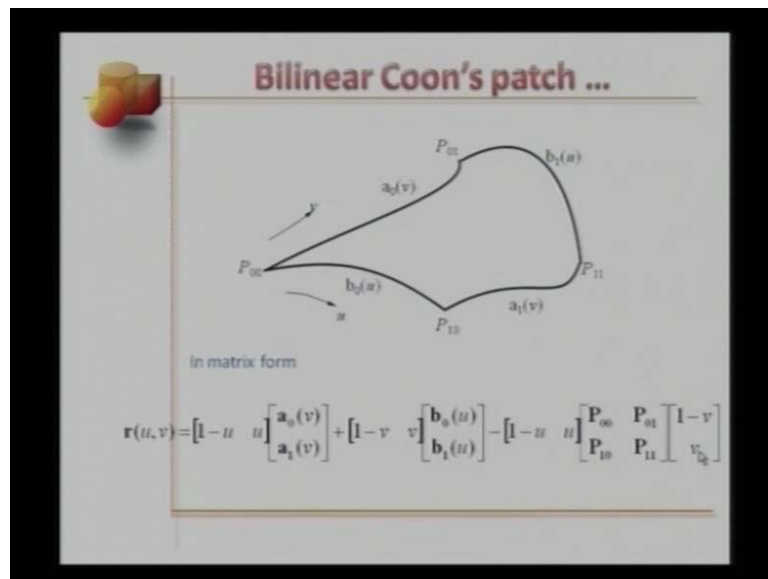

$$r_3(u, v) = (1-v)r_3(u, 0) + v r_3(u, 1)$$

$$= (1-v)(1-u)P_{00} + u(1-v)P_{10} + (1-u)vP_{01} + uvP_{11}$$

So, we have $r_3(u, 1)$ equals $(1-u)P_{01} + uP_{11}$ so, where are we heading. Let us copy the two results from before, one corresponding to $r_3(u, 1)$, which is equal to $(1-u)P_{01} + uP_{11}$ and the second corresponding to $r_3(u, 0)$, which is equal to $(1-u)P_{00} + uP_{10}$. What can we do with these two results, well we can linearly blend them in this manner so, we can linearly blend $r_3(u, 0)$ and $r_3(u, 1)$ to get $r_3(u, v)$ that is, $r_3(u, v)$ equals $(1-v)r_3(u, 0) + v r_3(u, 1)$ where, $r_3(u, 0)$ is this here and $r_3(u, 1)$ is this here.

That is equal to $1 - v$ times $1 - u$ times P_{00} plus u times $1 - v$ times P_{10} plus $u v P_{01}$ plus $u v P_{11}$. If you work the algebra properly, you will notice that, if you use $r = 3 - u - v$ in this form, $r = 3 - u - v$ which was the original model for this bilinear coon's patch, which was the sum of $r = 1 - u - v$ linear blend between b_0 and b_1 , $r = 2 - u - v$, which was the linear blend between a_0 and a_1 . And if you subtract $r = 3 - u - v$ from that sum, $r = 3 - u - v$ is given by this expression, you would realize that all your boundary conditions are met. What are your boundary conditions, these are your four corner points and these four are corresponding boundary curves.

(Refer Slide Time: 19:47)

In matrix form or in short form, the bilinear coon's patch is given by the row vector $1 - u$, u times a_0 of v , a_1 of v arranged in column form plus again, a row vector involving parameter v , which is $1 - v$, v times the column b_0 of u , b_1 of u , which are of these two boundary curves minus your correction surface, which is $1 - u$, u times P_{00} , P_{01} , P_{10} and P_{11} times the column vector, $1 - v$, v .

So, this is the mathematical expression for your bilinear coon's patch in a similar manner, can you think about creating a bicubic coon's patch. With these four bounding curves and to loft these curves, we would need cross boundary tangent information. Once again, with these four boundary curves and with the respective cross boundary tangent information, is it possible for us to create a bicubic coons patch. We will see this now, let me warn you before hand, that although the principle is relatively simple, the mathematical expressions involved are interrogate. I would like you to pay full attention to the following discussion.

(Refer Slide Time: 22:09)

So given, four boundary curves and four cross boundary tangents so, these are two, of the four curves b_0 of u and b_1 of u , these are the other two, a_0 of v and a_1 of v . For b_0 of u , we have the tangents as t_0 of u and for b_1 of u , We have the tangents as t_1 of u . What could these cross boundary tangents mean, well physically, if you stand at any of these points, t_0 of u would be a set of directions, which would be tangents along the v parameter direction.

Likewise, t_1 of u will be tangents, if you stand on any of these points on v_1 of u , again these would be the directions along the parameter v direction. Likewise, the other two sets of corresponding tangents s_0 of v and s_1 of v will be pointing along the parameter u direction like so. Recall now, what we did, when we created a lofted patch, for a given u , we choose a point, we choose the corresponding tangent direction.

For the same value of u , we choose a point here on this curve v_1 of u correspondingly, we also have the tangent information and we lofted a curve along the v direction, we are going to be doing something very similar here. As we did in case of bilinear coon's patch, we will create two lofted surfaces r_1 of $u v$ and r_2 of $u v$ and we will subtract a correction surface from this sum. So, these are the two parameter directions u and v , as you would know, these are four corner points P_{00} , P_{10} , P_{01} and P_{11} .

(Refer Slide Time: 25:15)

Bicubic Coon's patch ...

Follow a similar procedure as in Bilinear Coon's patch

Blend $b_0(u)$ and $b_1(u)$ using cross boundary tangents, $t_0(u)$ and $t_1(u)$

$$r_1(u, v) = \varphi_0(v) b_0(u) + \varphi_1(v) b_1(u) + \varphi_2(v) t_0(u) + \varphi_3(v) t_1(u)$$

Blend $a_0(v)$ and $a_1(v)$ using cross boundary tangents, $s_0(v)$ and $s_1(v)$

$$r_2(u, v) = \varphi_0(u) a_0(v) + \varphi_1(u) a_1(v) + \varphi_2(u) s_0(v) + \varphi_3(u) s_1(v)$$

Bicubic Coon's patch

$$r(u, v) = r_1(u, v) + r_2(u, v) - r_3(u, v)$$

Correction surface to meet boundary conditions
to be determined

As I mentioned before, we will follow a very similar procedure as in the bilinear coon's patch, to blend two boundary curves b_0 of u and b_1 of u using cross boundary tangents t_0 of u and t_1 of u to get r_1 of u, v equals φ_0 of v times b_0 of u plus φ_1 of v times b_1 of u plus φ_2 of v times t_0 of u plus φ_3 of v times t_1 of u . $\varphi_0, \varphi_1, \varphi_2$ and φ_3 , as you would realize, are might a bicubic polynomials in v .

(Refer Slide Time: 28:13)

Correction surface $r_3(u, v) \dots$

Diagram showing a quadrilateral patch with vertices $P_{00}, P_{10}, P_{01}, P_{11}$. Boundary curves $b_0(u), b_1(u), a_0(v), a_1(v)$ and cross boundary tangents $t_0(u), t_1(u), s_0(v), s_1(v)$ are shown.

$$r(u, 0) = \varphi_0(0) b_0(u) + \varphi_1(0) b_1(u) + \varphi_2(0) t_0(u) + \varphi_3(0) t_1(u) + \varphi_0(u) a_0(0) + \varphi_1(u) a_1(0) + \varphi_2(u) s_0(0) + \varphi_3(u) s_1(0) - b_0(u)$$

$$\Rightarrow r_3(u, 0) = \varphi_0(u) P_{00} + \varphi_1(u) P_{10} + \varphi_2(u) s_0(0) + \varphi_3(u) s_1(0)$$

$$r_1(u, v) = \varphi_0(v) b_0(u) + \varphi_1(v) b_1(u) + \varphi_2(v) t_0(u) + \varphi_3(v) t_1(u)$$

$$r_2(u, v) = \varphi_0(u) a_0(v) + \varphi_1(u) a_1(v) + \varphi_2(u) s_0(v) + \varphi_3(u) s_1(v)$$

Likewise, we are going to be blending the two other boundary curves a_0 of v and a_1 of v and we will use cross boundary tangents s_0 of v and s_1 of v . And this way, we will create the other

lofted patch mark r_2 of u and v is equal to π_0 now, it is going to be a function of u times a $0 v$ plus π_1 of u times a $1 v$ plus π_2 of u times $s_0 v$ plus π_3 u times $s_1 v$. So, our bicubic coon's patch is given by r of u and v is equal to r_1 of $u v$ plus r_2 of $u v$ minus the corrections surface, as in the case of bilinear coon's patch, which is r_3 of $u v$. Once again, we will determine this correction surface to meet all the requisite boundary conditions.

Let us continue so, I have copied the expressions for r_1 $u v$ here and r_2 $u v$ here, we will need these expressions to compute the corrections of this r_3 of u and v . So, this is the information that we have, the four boundary curves and the four sets of cross boundary tangents. Now, let us compute, what are u_0 is, plug in the value of v equals 0 here and here. So, we have π_0 of 0 times b_0 u plus π_1 of 0 times b_1 of u plus π_2 of 0 times t_0 of u plus π_3 of 0 times t_1 of u plus π_0 of u a $0 0$ plus π_1 of u a $1 0$ plus π_2 of u is $0 0$ plus π_3 u $s_1 0$.

And of course, we are subtracting the correction surface r_3 of u and now, v equal 0 , as I mentioned, the expressions will be quite interrogate and what is r_u , for v equals 0 , this is this boundary curve b_0 of u . Let us analyze this a little further, if you remember your Hermite cubic functions, you would notice that π_0 of 0 is 1 and all the other three will be 0 . What is next, look at a 0 of 0 along this curve for v equals 0 , we have point $P_0 0$, about a $1 0$, we are on this curve here v equals 0 , we are standing on $P_1 0$.

(Refer Slide Time: 32:01)

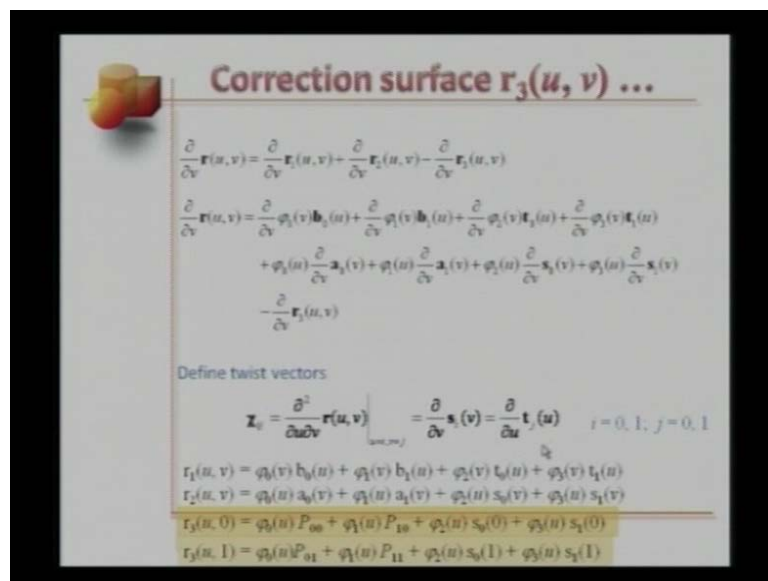

How about s_0 of 0 and s_1 of 0 , we are looking at the cross boundary tangents s_0 of p , for v equals 0 , the cross boundary tangents along the u direction will be defined at $P_0 0$, $s_1 0$. You

are looking at these sets of cross boundary tangents and for v equals 0, s_1 of 0 will be defined at p_1 of 0. We will come to these later, for now, if we solve this equation we have r_3 of u equals p_0 of u times P_0 plus p_1 of u times P_1 plus p_2 of u times s_0 and p_3 of u times s_1 .

If you notice, this term here it cancels out with this term and here, we are taken this term on the right hand side here, let us proceed. So, we have this patch and now, we are interested in finding what are u_1 is, all we need to do is, to plug in value of v equals 1 here, here and we need to subtract r_3 of u_1 on this sum. So, the sum is p_0 of 1 times b_0 of u plus p_1 of 1, b_1 of u plus p_2 of 1, t_0 of u plus p_3 of 1 t_1 of u .

Plug in v equals 1 in this expression to get this expression, again plug in v equals 1 here to get this expression, which is p_0 of u a 0_1 plus p_1 of u a 1_1 plus p_2 of u s_0 plus p_3 of u s_1 . And of course, we have minus r_3 of u_1 and after all, what is r_3 of u_1 , this is for v equals 1 will have this boundary curve here, b_1 of u . Once again, if you remember the expressions for Hermite cubic functions, this term goes to 0, this term goes to 1, this goes to 0 and this goes to 0.

(Refer Slide Time: 36:05)

We can simply this complex looking equation as. r_3 of u_1 equals p_0 of u times p_0 plus p_1 of u times P_1 plus p_2 of u s_0 plus p_3 of u s_1 . Look at this expression here, where did this come from, a 0_1 , v on this curve would be equals 1 to get P_0 . Once again, a 1_1 , v on this curve would be equals 1, we get P_1 , these are the cross boundary tangents at v equals 1, here and here for this one. Do you have an tinkling, as to what we are trying to do here, in the previous slide, we computed r_3 of u_0 here, we compute r_3 of u_1 . And if you notice, r_1 of u v and r

2 of u, v were two lofted patches, that were created using the boundary curves and the cross boundary tangents. We are trying to do something very similar here to find r_3 , let us see, what is in $(())$ next.

So here, I have copied the four important results, that we would need r_1 of u, v , r_2 of u, v , r_3 of u, v , you must have noted down these expressions in your notes. All we would want you do now is, to think about creating a lofted patch to get r_3 and for that, we would need information of the first partial derivative r with respect to v . So, $\frac{\partial r}{\partial v}$ is $\frac{\partial r_1}{\partial v}$ plus $\frac{\partial r_2}{\partial v}$ minus $\frac{\partial r_3}{\partial v}$.

So, thus unfolds the suspense, if we plug in value for v as 0 and 1 respectively, we will have first derivative information of r_3 with respect to v . So, with these two information and with these two, we can think of creating a lofted patch for r_3 . So, $\frac{\partial r}{\partial v}$ will be equal to partial of this expression, with respect to v plus partial of r_2 with respect to v minus partial of r_3 with respect to v .

So, the first expression is, partial of p_0 with respect to v times $b_0(u)$ plus partial of p_1 with $b_1(u)$ times v plus partial of p_2 with v times $t_0(u)$ plus partial of p_3 with v times $t_1(u)$ plus $p_0(u)$ times partial of $a_0(v)$ over partial v plus $p_1(u)$ times partial of $a_1(v)$ over partial v plus $p_2(u)$ times partial of $s_0(v)$ over partial v plus $p_3(u)$ times partial of $s_1(v)$ over partial v , minus partial of r_3 over partial v , which is this term here.

(Refer Slide Time: 40:33)

Correction surface $r_3(u, v) \dots$

Note that for $v = 0$

$$\frac{\partial}{\partial v} \mathbf{a}_0(0) = \mathbf{t}_0(0)$$

$$\frac{\partial}{\partial v} \mathbf{a}_1(0) = \mathbf{t}_0(1)$$

$$\frac{\partial}{\partial v} \mathbf{r}(u, 0) = \mathbf{t}_0(u) + \varphi_0(u) \mathbf{t}_0(0) + \varphi_1(u) \mathbf{t}_0(1) - \varphi_2(u) \mathbf{t}_{20} - \varphi_3(u) \mathbf{t}_{30} - \frac{\partial}{\partial v} \mathbf{r}_3(u, 0)$$

$$= \mathbf{t}_0(u)$$

And for $v = 1$

$$\frac{\partial}{\partial v} \mathbf{a}_0(1) = \mathbf{t}_1(0)$$

$$\frac{\partial}{\partial v} \mathbf{a}_1(1) = \mathbf{t}_1(1)$$

$$\frac{\partial}{\partial v} \mathbf{r}(u, 1) = \mathbf{t}_1(u) + \varphi_0(u) \mathbf{t}_1(0) + \varphi_1(u) \mathbf{t}_1(1) + \varphi_2(u) \mathbf{t}_{21} + \varphi_3(u) \mathbf{t}_{31} - \frac{\partial}{\partial v} \mathbf{r}_3(u, 1)$$

$$= \mathbf{t}_1(u)$$

$$r_3(u, 0) = \varphi_0(u) P_{00} + \varphi_1(u) P_{10} + \varphi_2(u) S_0(0) + \varphi_3(u) S_1(0)$$

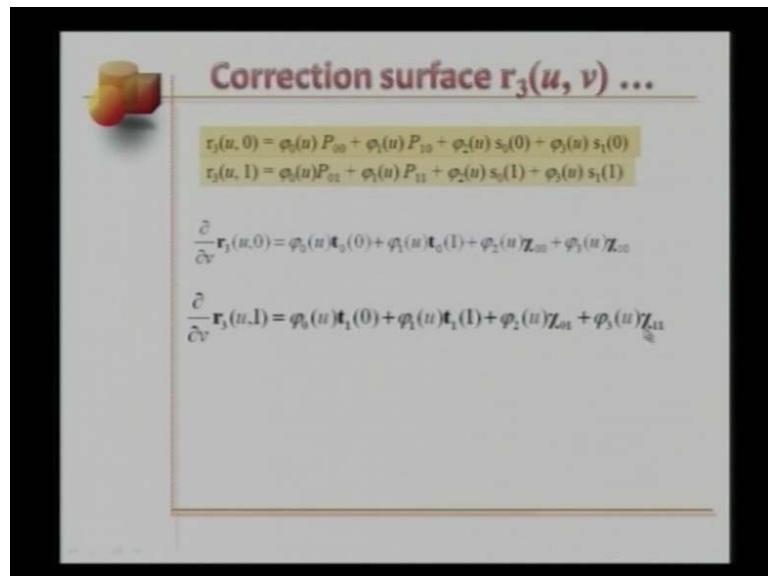

$$r_3(u, 1) = \varphi_0(u) P_{01} + \varphi_1(u) P_{11} + \varphi_2(u) S_0(1) + \varphi_3(u) S_1(1)$$

Once again, you can compute the first derivatives with respect to v to these expressions here, let us now, define twist vectors denoted by x_i sub i j , which is equal to the next derivative of r u v with respect to u and v . Evaluated at u equals i and v equals j , i and j would go from 0 to 1, these makes derivatives are equal to partial s_i v over partial v , which are also equal to partial t_j u over partial u , as I said before, I can assume any value 0 or 1 and so is the case with j .

We will need these expressions r_2 of u 0 and r_3 of u 1, so I have copied these equations right here. Now, for a value v equals 0, partial a_0 of 0 with respect to v so, in a sense that, in this we are computing partial of a_0 v with respect to v and evaluating that, at v equals 0 and that, will be equal to t sub 0 evaluated at 0. Likewise, partial of a_1 v over partial v where, v equals 0 is equal to t sub 0 evaluated at 1. This is our coon's patch, this vector here will correspond to t sub 0 evaluated at u equals 0 likewise, this vector here will be equal to t_0 for u equals 1.

Partial of r over partial v , for v equals 0 is equal to t_0 u plus π_0 u t_0 at 0 plus π_1 u times t_0 at 1 plus π_2 u times x_{i0} plus π_3 u times x_{i1} 0 minus partial r_3 with respect to v evaluated at u equals 0 and v equals 0. And that, is equal to t_0 of u , for v equals 1, partial of a_1 with respect to v , for v equals 0 is equal to t_1 of 0 and partial of a_1 with respect to v , for v equals 1 is t_1 , evaluated at 1.

(Refer Slide Time: 44:57)

These two vectors are given by these red arrows, t_1 at u equals 0 and t_1 at u equals 1. So, we will have partial of r with v , for u and v equals 1 is equal to t_1 of u plus π_0 of u t_1 at 0 plus π_1 u t_1 at 1 plus π_2 u times x_{i0} 1 plus π_3 u times x_{i1} 1 minus partial of r_3 with v , for u

equals u and v equals 1 and that, will be equal to $t = 1$ at u . So, from this equation, we can compute partial r_3 with respect to v at u and 0 , and from this equation, we can compute partial of r_3 with v at u and 1 . And we already have information pertaining to r_3 , for u and 0 and r_3 , for u and 1 , all we need to do is, use the set of four data to create a lofted surface r_3 .

To summarize, r_3 of $u = 1, 0$ is $\pi_0 u, P_{00}$ plus $\pi_1 u p_{10}$ plus $\pi_2 u s_{00}$ plus $\pi_3 u s_{10}$, r_3 at u and v equals 1 is equal to $\pi_0 u v_{01}$ plus $\pi_1 u p_{11}$ plus $\pi_2 u s_{01}$ plus $\pi_3 u s_{11}$. And just about now, we had computed what partial r_3 , for partial v or for v equals 0 and v equals 1 . Here, respectively, $\pi_0 u t_{00}$ plus $\pi_1 u t_{01}$ plus $\pi_2 u x_{i00}$ plus $\pi_3 u x_{i10}$ and $\pi_0 u t_{10}$ plus $\pi_1 u t_{11}$, evaluated at 1 plus $\pi_2 u x_{i01}$ plus $\pi_3 u x_{i11}$.

(Refer Slide Time: 46:24)

$$r_3(u,v) \quad r_3(u,0), r_3(u,1); \quad \frac{\partial r_3(u,0)}{\partial v} \quad \frac{\partial r_3(u,1)}{\partial v}$$

$$r_3(u,v) = \phi_0(v) \cdot r_3(u,0) + \phi_1(v) \cdot r_3(u,1) + \phi_2(v) \cdot \frac{\partial r_3(u,0)}{\partial v} + \phi_3(v) \cdot \frac{\partial r_3(u,1)}{\partial v}$$

For the correction surface, $r_3 u v$, this is the information we have, $r_3 u 0, r_3 u 01$, partial r_3 over partial v at u and 0 , and partial r_3 over partial v at u and 1 . With this information, it is very natural for us to create a lofted surface $r_3 u v$, as π_0 , now a function of v , times $r_3 u 0$ plus π_1 , function of v , times $r_3 u 1$ plus π_2 function of v , times partial r_3 over partial v $u 0$ plus π_3 of v times partial r_3 over partial v $u 1$. These are the expressions, we will have as functions of u and π_0, π_1, π_2 and π_3 will be Hermite polynomials in v . We can do the math and verify that, $r_3 u v$ constructed in this manner would satisfy all the boundary conditions, pertaining to the corner points, pertaining to the bounding curves and also relating to the cross boundary tangents. By this time, you would already have the expression for $r_3 u 0, r_3 u 1$, the slope with respect to v evaluated at $u 0$ of r_3 and the slope with respect to v of r_3 evaluated at $u 1$.
