Lecture - 25
Robot Dynamics (Contd.)

Now I am going to discuss how to determine the inertia tensor for the robotic link having circular cross section.

(Refer Slide Time: 00:20)

Their length of the robotic link is s into equal to l and it is having the circular cross section with the radius r . Now here I am just going to consider a small element, the same element I am just going to redraw here. So, this is a $X Y$ and Z . So, the coordinate system is attached here.

Now, let us try to concentrate on this small element, now this is r this particular included angle is your θ . So, this arc is nothing but your $r d \theta$. So, this is nothing but is your $r d \theta$ and this is a dr . So, the cross sectional area of this part is shaded part is nothing but is your $r d \theta$ multiplied by dr and so, to determine the volume that is your dv . So, what we do is; so this area $r d \theta dr$ multiplied by dx . So, this is nothing but the volume.

So, if I want to find out the differential mass that is dm is nothing but ρdv and that is nothing but is your ρr then comes your $d\theta dr dx$. So, this is nothing but the differential mass of this small element. So, the differential mass of this small element is nothing but $\rho r d\theta dr dx$. And now let us try to find out its moment of inertia and before that let me write down, that this particular y, Z is nothing but. So, this is a r this is θ . So, Z is $r \cos \theta$ and your Y is nothing but $r \sin \theta$.

Now, using this particular expression, now we can find out the moment of inertia.

(Refer Slide Time: 02:39)

Let us consider a link of length l having circular cross-section of radius r

$$y = r \sin \theta$$

$$z = r \cos \theta$$

Volume of small element $dv = r d\theta dr dx$

Mass of small element $dm = \rho dv$, where $\rho =$ density

Moment of Inertia

$$I_{xx} = \int_V (y^2 + z^2) dm = \int_{-l}^0 \int_0^r \int_0^{2\pi} r^2 \rho r d\theta dr dx = \frac{1}{2} mr^2$$

Handwritten red notes on the slide: $y^2 + z^2 = r^2 \sin^2 \theta + r^2 \cos^2 \theta = r^2$

IIT KHARAGPUR | NPTEL ONLINE CERTIFICATION COURSES

Now this your differential mass as I told a ρdv that is a $\rho r d\theta dr dx$ where ρ is the density. Now moment of inertia about xx that is a I_{xx} is nothing but volume integration $Y^2 + Z^2 dm$. Now $Y^2 + Z^2$ is nothing but your $Y^2 + Z^2$ is nothing but $Y^2 + Z^2$ is nothing but $r^2 \sin^2 \theta + r^2 \cos^2 \theta$. So, this is nothing but your r^2 . So, this is nothing but r^2 .

So, $Y^2 + Z^2$ is nothing but r^2 and this particular dm is nothing but $\rho r d\theta dr dx$ and let us try to find out the limit of this integration now $d\theta$. So, θ will vary from 0 to 2π , then comes your r r will vary from 0 to r and X will vary from $-l$ to 0 now let us let us try to see what happens like how to decide the range for this particular x .

(Refer Slide Time: 04:00)

Now, here we have got the origin of the coordinate system.

So, it is from minus l to 0 that is the range for your X now if this is the range for X.

(Refer Slide Time: 04:13)

Let us consider a link of length l having circular cross-section of radius r

$$y = r \sin \theta$$

$$z = r \cos \theta$$

Volume of small element $dv = r \, d\theta \, dr \, dx$

Mass of small element $dm = \rho \, dv$, where $\rho = \text{density}$

Moment of Inertia

$$I_{XX} = \int_V (y^2 + z^2) \, dm = \int_{-l}^0 \int_0^r \int_0^{2\pi} r^2 \rho \, r \, d\theta \, dr \, dx = \frac{1}{2} m r^2$$

m = π r² × l × ρ

So, we can find out this and we can carry out this integration. And if we carry out this integration we will be getting half $m r^2$, where m is nothing but the mass of this particular the link having a circular cross section. Now this mass m can be determined as πr^2 multiplied by l is the volume multiplied by ρ that is a density is nothing but the mass of this particular the link.

So, half $m r$ square is nothing but the moment of inertia about xx .

(Refer Slide Time: 04:54)

$$\begin{aligned} I_{yy} &= \int_V (x^2 + z^2) dm \\ &= \int_{-l}^0 \int_0^r \int_0^{2\pi} (x^2 + r^2 \cos^2 \theta) \rho r d\theta dr dx \\ &= \frac{ml^2}{3} + \frac{mr^2}{4} \end{aligned}$$

The slide also features the IIT Kharagpur and NPTEL logos at the bottom, along with a small video inset of the presenter.

Now if I see this moment of inertia about yy . So, that is nothing but the volume integration Y square plus Z square dm . So, sorry s square plus Z square dm . So, in place of Z square I am putting r square \cos square θ , and next is your dm is $\rho r d\theta dr dx$ and if you carry out this particular integration and if these are the limits for integration. So, very easily you can find out. So, this particular expression for I_{yy} that is nothing but the moment of inertia about yy that is a ml square by 3 plus mr square by 4.

(Refer Slide Time: 05:42)

$$\begin{aligned} I_{zz} &= \int_V (x^2 + y^2) dm \\ &= \int_{-l}^0 \int_0^r \int_0^{2\pi} (x^2 + r^2 \sin^2 \theta) \rho r d\theta dr dx \\ &= \frac{ml^2}{3} + \frac{mr^2}{4} \end{aligned}$$

The slide also features the IIT Kharagpur and NPTEL logos at the bottom, along with a small video inset of the presenter.

So, following this I can also find out the moment of inertia about zz and that is nothing but volume integration $X^2 + Y^2 dm$ and a Y^2 is nothing but $r^2 \sin^2 \theta$ then $\rho r d\theta dr dx$. And if we carry out this particular integration we will be getting ml^2 by 3 plus mr^2 by 4. So, I can find out the moment of inertia about zz the next is the product of inertia.

(Refer Slide Time: 06:10)

Product of Inertia

$$I_{XY} = \int_V xy dm$$

$$= \int_{-l}^0 \int_0^r \int_0^{2\pi} x r \sin \theta \rho r d\theta dr dx$$

$$= 0$$

Similarly, $I_{YZ} = 0 ; I_{ZX} = 0$

Handwritten notes on the slide:

$$I_{YZ} = \int_V yz dm$$

$$I_{ZX} = \int_V zx dm$$

The product of inertia I_{xy} is nothing but the volume integration $xy dm$.

Now here, Y is nothing but your $r \sin \theta$ and dm is $\rho r d\theta dr dx$ and these are the ranges for the integration and if you carry out this integration, we will be getting I_{xy} is equal to 0. Now by following the similar method we can also find out what is I_{yz} . The and I_{yz} is nothing but is your the volume integration $yz dm$ and if you carry out this integration I will be getting I_{yz} is equals to 0. Similarly I can also find out the product of inertia that is I_{zx} and that is nothing but your $Zx dm$. And if I carry out this particular integration and we will be able to find out that I_{zx} is equal to 0.

(Refer Slide Time: 07:24)

The slide displays the following mathematical derivations and a diagram:

$$\int_V x dm = \int_{-l}^0 \int_0^r \int_0^{2\pi} x \rho r d\theta dr dx$$
$$= -\frac{1}{2} ml$$
$$\int_V y dm = 0$$
$$\int_V z dm = 0$$
$$\int_V dm = m$$

The mass center is given by:

$$\text{Mass center} = (\bar{x}_i, \bar{y}_i, \bar{z}_i) = (-l/2, 0, 0)$$

The diagram shows a 3D cylinder of length l along the x -axis, with a red dot representing the mass center at $x = -l/2$.

Logos for IIT KHARAGPUR and NPTEL ONLINE CERTIFICATION COURSES are visible at the bottom of the slide.

Now here, we have got this particular product of inertia, now volume integration $x dm$ if you carry out. So, I will be getting minus half ml then integration volume integration $y dm$ will become equal to 0, then volume integration $z dm$ will become equals to 0. Now the mass center that is $\bar{x}_i, \bar{y}_i, \bar{z}_i$ is nothing but minus l by 2 0 0 like if I draw this particular circular cross section that robotic link. So, my X direction is along this particular direction and the total length is l .

So, its mass center will be here whose coordinate is nothing but minus l by 2 0 0 . So, this is nothing but the coordinate of the mass center. Then comes your integration the volume integration or over dm so is nothing but m . So, we can find out all such integration and this is a once again the volume integration next is. So, once you have got all such expression Now, I can find out the inertia tensor.

(Refer Slide Time: 08:40)

The slide displays two inertia tensor matrices and two diagrams. On the left, under the heading "Inertia Tensor", is a 4x4 matrix J_i with elements: $\frac{ml^2}{3}$, 0, 0, $-\frac{ml}{2}$ in the first row; 0, $\frac{mr^2}{4}$, 0, 0 in the second row; 0, 0, $\frac{mr^2}{4}$, 0 in the third row; and $-\frac{ml}{2}$, 0, 0, m in the fourth row. Red circles and arrows highlight the $\frac{mr^2}{4}$ terms. On the right, under the heading "For a slender link ($l \gg r$)", is a simplified 4x4 matrix J_i with elements: $\frac{ml^2}{3}$, 0, 0, $-\frac{ml}{2}$ in the first row; 0, 0, 0, 0 in the second row; 0, 0, 0, 0 in the third row; and $-\frac{ml}{2}$, 0, 0, m in the fourth row. Below the matrices are two diagrams: a rectangle with dimensions a and b , and a square with dimension a .

So, this inertia tensor for this particular link with circular cross section, that is denoted by J_i will become equal to ml^2 by 3 0 0 minus ml by 2 then comes 0 mr^2 by 4 0 0 0 mr^2 by 4 0 minus ml by 2 0 0 m .

Now, if I consider the slender link where l is very large compared to r , l is very large compared to your r in that case this mr^2 by 4. So, this can be neglected. So, this tends to 0, then mr^2 by 4 tends to 0. So, this will become the inertia tensor will become ml^2 by 3 0 0 minus ml by 2, then comes 0 0 0 0 0 0 0 0 minus ml by 2 0 m . So, this is nothing but the inertia tensor for the robotic link having circular cross section of radius r .

Now here, till now we have considered the rectangular cross section having the dimension a and b . So, I can also consider the square cross section like having the dimensions a and a . So, for this particular cross section robotic link we can also find out the inertia tensor. Now if you see the ρ in robot we generally do not consider. So, this type of robotic link having the constant cross section. If you see in the robotic link the cross section is varying the same is true in our hand also.

For example say if I consider say this is the robotic links. Now if I take one cross section here if I take another cross section here the cross section is not the same. So, cross section is going to vary and it is having the varying cross section. So, determining this inertia tensor is not so easy, the same is true for the actual robotic link. In actual robotic

link generally we do not consider the link with constant cross section and the cross section is going to vary along the length.

So, it is bit difficult to determine the inertia tensor. In fact, we try to take the help of some sort of finite element analysis to find out what should be that particular your inertia tensor. So, this is the way actually we try to find out the inertia tensor for the robotic link.

(Refer Slide Time: 11:30)

Determination of Robotic Joint Torques

Lagrange-Euler Formulation

$$\frac{d}{dt} \left(\frac{\partial L}{\partial \dot{q}_i} \right) - \frac{\partial L}{\partial q_i} = \tau_i$$

Where $i = 1, 2, \dots, n$
 n = No. of joints
 L : Lagrangian function
 $L = K(K.E) - P(P.E)$
 q_i = Generalized coordinates
 $q_i = \theta_i$ for a rotary joint
 $= d_i$ for a prismatic joint

\dot{q}_i = first time (t) derivative of q_i
 τ_i : Generalized torque for a rotary joint
 : Generalized force for a linear joint

IIT KHARAGPUR | NPTEL ONLINE CERTIFICATION COURSES

And once you have got the inertia tensor, now we are in a position to determine the expression the mathematical expression for the joint torque or the joint force.

Now, here actually we are going to use a Lagrange Euler formulation truly speaking this is the Lagrangian method Lagrange approach. Now the rule is or the equation is something like this ddt of partial derivative of L with respect to qi dot minus the partial derivative of L with respect to qi is nothing but your tau i. Now I am just going to define the different terms. So, here the T is nothing but time. Now L is nothing but the Lagrangian a Lagrangian of a system of a robotic system is nothing but the difference between the kinetic energy and the potential energy, that is nothing but the lagrangian of the robotic system.

Now, here this qi is the generalize coordinate for example, if it is a rotary joint. So, qi is nothing but theta i that is the joint angle if it is a prismatic joint that is nothing but the link offset that is di now qi dot is nothing but the first time derivative of qi and your tau i

is nothing but the generalized torque if it is a rotary joint and if it is a linear joint, that is nothing but the generalized force. So, our aim is to determine the mathematical expression for this particular the tau. Now let us see how to determine the mathematical expression for this particular tau.

Now, to find out this mathematical expression, the first thing we will have to do is we will have to find out the expression for this particular the Lagrangian. And this Lagrangian is nothing but once again this is the difference between the kinetic energy and the potential energy; that means, we will have to determine the kinetic energy for the whole robot. And we will have to find out the potential energy and this particular difference of kinetic energy and potential energy is nothing but is Lagrangian.

So, my first task is to determine the Lagrangian of this particular the robotics system, now let us see how to determine the Lagrangian of this particular the robotic system.

(Refer Slide Time: 14:10)

Let us consider i -th link of a serial manipulator
 Position of a fixed point lying on this link

$${}^i r = \begin{bmatrix} X_i \\ y_i \\ z_i \\ 1 \end{bmatrix}$$

$${}^0 r = {}^0 T_i {}^i r$$

where ${}^0 T_i = {}^0 T_1 {}^1 T_2 \dots {}^{i-1} T_i$

Now let me once again start with a particular the elements small element whose the coordinate in its own the coordinate system. For example, say if I consider just like the previously the way I consider, say I have got is a robotic link and here the coordinate system I am having here and the motor is connected here ok.

So, I am just trying to find out the mass center here and if I just consider a particular point or say this particular point. So, this point in this coordinate system is nothing but r_i

with respect to i . Now with respect to the base coordinate system. So, the same point I am just going to find out and that is nothing but is your r_i with respect to 0. So, our aim is to determine. So, this particular r_i with respect to 0, but in this particular point; so I am just trying to find out. So, this particular point not this; so this particular point with respect to the base coordinate system.

So, this is nothing but r_i with respect to 0, and this I am trying to find out provided this is known that is a r_i with respect to i . So, this r_i with respect to i is nothing but $X_i Y_i Z_{i-1}$ and this r_i with respect to 0 is nothing but T_i with respect to 0 multiplied by r_i with respect to i . Now, this T_i with respect to 0 is nothing but T_1 with respect to 0 T_2 with respect to one up to T_i with respect to $i-1$ and this particular T is nothing but the transformation matrix.

(Refer Slide Time: 16:12)

Let us consider i -th link of a serial manipulator
Position of a fixed point lying on this link

$${}^i_i r = \begin{bmatrix} X_i \\ Y_i \\ Z_i \\ 1 \end{bmatrix}$$

$${}^0_i r = {}^0_i T {}^i_i r$$

where ${}^0_i T = {}^0_1 T {}^1_2 T \dots {}^{i-1}_i T$

Now, once again let me let me repeat. So, so this is actually the circular link and my coordinate system is here ok. So, I have got a point here and with respect to this particular coordinate system. So, this dimension is nothing but r_i with respect to i and I have got the base coordinate system here and the same point I am trying to find out and that is nothing but is your r_i with respect to 0. So, r_i with respect to 0 is nothing but T_i with respect to 0 multiplied by this r_i with respect to i and this is nothing but the i -th coordinate system and this is nothing but the base coordinate system.

So, in i-th coordinate system, this particular the position vector is known, now I am trying to find out r_i with respect to the base coordinate point base coordinate frame the same point. So, this is the way actually we can represent your r_i with respect to 0.

(Refer Slide Time: 17:27)

Determination of Kinetic Energy (K) of the Manipulator
Velocity of a particle of link i w.r. to base coordinate system

$${}^0\bar{V} = \frac{d}{dt} ({}^0\bar{r})$$

$${}^0\bar{V} = \frac{d}{dt} ({}^0T_i \bar{r}) = {}^0\dot{T}_1 T_2 \dots T_i \bar{r} + \dots + {}^0T_1 T_2 \dots T_{i-1} \dot{T}_i \bar{r} + {}^0T_1 \dot{\bar{r}}$$

$$= \left(\sum_{j=1}^i \frac{\partial {}^0T_i}{\partial q_j} \dot{q}_j \right) {}^i\bar{r}, \text{ as } \dot{\bar{r}} = 0$$

Let $\frac{\partial {}^0T_i}{\partial q_j} = U_{ij}$ Therefore, ${}^0\bar{V} = \left(\sum_{j=1}^i U_{ij} \dot{q}_j \right) {}^i\bar{r}$

Note: $U_{ijk} = \frac{\partial U_{ij}}{\partial q_k}$

Handwritten notes on the slide include: $\frac{1}{2} m V^2 = KE$ and a diagram showing transformation matrices: ${}^0T_1, {}^1T_2, \dots, {}^{i-1}T_i$.

Now actually what I am going to do is, I am trying to find out the kinetic energy of the whole robot. Now if I want to find out the kinetic energy, the kinetic energy is nothing but half mv square.

So, the expression for the kinetic energy is nothing but half mass multiplied by V square. So, this is nothing but the kinetic energy. Now here actually what we are going to do, first we are trying to find out the kinetic energy of one small element lying on a particular link then we are trying to find out the kinetic energy for the whole links say i -th link and after that we will try to find out the kinetic energy for the whole robot or the whole robotic system.

Now, to determine the kinetic energy of the particle; so what you do is, you will have to find out the velocity of the particle. Now the velocity of the particle that is V_i with respect to 0 with respect to the base coordinate frame. So, this is nothing but the rate of change of the position; that means, your ddt of r_i with respect to 0. So, this r_i with respect to 0 is nothing but the position of that particular the differential mass with respect to your the base coordinate frame, and a rate of change of that particular position with

respect to time is nothing but V_i with respect to 0; that means, the velocity of that particular particle with respect to your the base coordinate frame.

Now, this r_i with respect to 0 as I told can be written as T_i with respect to 0 multiplied by r_i with respect to i . Now, this T_i with respect to 0; so this can be written as T_i with respect to 0 is nothing but T_1 with respect to 0 multiplied by T_2 with respect to 1 and the last term will be your T_i with respect to your $I - 1$ T stands for your transformation matrix.

Now, I will have to find out the derivative with respect to time. So, this T_i with respect to 0 is nothing but this. So, if I find out the derivative with respect to time. So, first I will have to concentrate on this that is T_1 with respect to 0 dot multiplied by T_2 with respect to 1 and there are a few terms, and the last term is T_i with respect to $i - 1$.

The next term will be like T_1 with respect to 0. So, here T_1 with respect to 0, then T_2 with respect to one dot then comes the last term will be your like T_i with respect to $i - 1$ ok. So, multiplied by r_i with respect to I , and the last term will be this that is T_1 with respect to 0 T_2 with respect to 1. And the last term is your T_i with respect to $i - 1$ dot multiplied by r_i with respect to i plus T_i with respect to 0. So, this particular r_i with respect to i dot. So, this is another term.

So, this is the way actually we can find out this particular the time derivative now let us try to concentrate on this particular term. Now if we concentrate on this particular term.

(Refer Slide Time: 21:13)

Determination of Kinetic Energy (K) of the Manipulator
Velocity of a particle of link i w.r. to base coordinate system

$${}^0\bar{V} = \frac{d}{dt} ({}^0\bar{r})$$

$${}^0\bar{V} = \frac{d}{dt} ({}^0T_1 T_1^i \bar{r}) = \underbrace{{}^0\dot{T}_1 T_1^i \bar{r} + \dots + {}^0T_1 \dot{T}_2 T_2^i \bar{r} + \dots + {}^0T_1 T_2 \dots T_{i-1} \dot{T}_i T_i^i \bar{r}}_{\text{rigid links}} + {}^0T_1 T_2 \dots T_{i-1} \dot{T}_i T_i^i \bar{r}$$

Let $\frac{\partial {}^0T_i}{\partial q_j} = U_{ij}$ Therefore, ${}^0\bar{V} = \left(\sum_{j=1}^i U_{ij} \dot{q}_j \right) {}^0\bar{r}$ as $\dot{\bar{r}} = 0$

Note: $U_{ijk} = \frac{\partial U_{ij}}{\partial q_k}$

IIT KHARAGPUR | NPTEL ONLINE CERTIFICATION COURSES

So, this r_i with respect to \dot{i} means what supposing that I have got one robotic link the rigid link something like this. Now, if this is the rigid link and I am just going to concentrate on a particular point ok. And this supposing that I have got the coordinate system here. So, this is actually the position of this particular the differential mass and this is nothing but r_i with respect to \dot{i}

Now, the rate of change of this particular position with respect to time will be 0, because this is a rigid link. So, this is a rigid link. So, for this particular rigid link your this r_i with respect to \dot{i} is nothing but is equal to 0. So, this particular term will become equal to 0. So, we are left with this up to this. Now here I just want to mention that if we consider robotic link like flexible robotic link, we cannot assume that this r_i with respect to \dot{i} is equal to 0. So, this will become nonzero for a flexible link and we have a few robot having flexible link also.

And determining this particular your V_i with respect to 0 is not so, easy and we will have to consider. So, this particular your flexible link and this particular term is non-zero and to determine once again we will have to take the help of finite element analysis. Now here actually a what we do is so, if you can see. So, this particular term this particular term can be written like this in a short form.

(Refer Slide Time: 22:52)

Determination of Kinetic Energy (K) of the Manipulator
Velocity of a particle of link i w.r. to base coordinate system

$${}^0\bar{V} = \frac{d}{dt} ({}^0\bar{r}^i)$$

$${}^0\bar{V} = \frac{d}{dt} ({}^0T_1 T_2 \dots T_{i-1} T_i \bar{r}^i) = \dots + {}^0T_1 T_2 \dots T_{i-1} \dot{T}_i \bar{r}^i + {}^0T_1 T_2 \dots T_{i-1} T_i \dot{\bar{r}}^i$$

$$= \left(\sum_{j=1}^i \frac{\partial {}^0T_i}{\partial q_j} \dot{q}_j \right) {}^i\bar{r}^i, \text{ as } \dot{\bar{r}}^i = 0$$

Let $\frac{\partial {}^0T_i}{\partial q_j} = U_{ij}$ Therefore, ${}^0\bar{V} = \left(\sum_{j=1}^i U_{ij} \dot{q}_j \right) {}^i\bar{r}^i$

Note: $U_{ijk} = \frac{\partial U_{ij}}{\partial q_k}$

Handwritten notes on the slide include: $\frac{d({}^0T_i)}{dt} = \frac{\partial({}^0T_i)}{\partial q_j} \times \frac{dq_j}{dt}$ and $\frac{d({}^0T_i)}{dt} = \frac{\partial({}^0T_i)}{\partial q_j} \times \frac{dq_j}{dt}$.

Now if we concentrate on this. So, that is your ddt that is the derivative with respect to time of your T i with respect to 0.

So, this is nothing but the transformation matrix. Now ddt of T i with respect to 0. So, this can be written as the partial derivative with respect to your q j partial derivative with respect to qj multiplied by d q dt. So, ddt of T i with respect to 0 is nothing but the partial derivative of this of T i with respect to 0 multiplied by dq dt let me write it once again. So, d dt of T i with respect to 0 is nothing but the partial derivative with respect to qj of T i with respect to 0 multiplied by is your dq dt.

So, it can be written something like this ok. So, this particular term has been written in this particular form that is your partial derivative with respect to qj of T i with respect to 0, and dq dt is nothing but qj dot and we have got this particular thing that is a r i with respect to i. So, this particular expression can be written in short form like this, and this is nothing but is your like vi with respect to 0; that means, the velocity of that particular particle with respect to the base coordinate frame is nothing but this particular the expression.

Now, here I am just going to use another symbol that is partial derivative of T i with respect to 0 with respect to your qj is nothing but U ij is a another symbol I am using; that means, your vi with respect to 0 can be written as summation j equals to 1 to i, then comes U ij. So, U ij is what; so this in place of this particular. So, I am using U ij

multiplied by \dot{q}_j multiplied by r_i with respect to i and here this U_{ijk} is nothing but the partial derivative of U_{ij} with respect to q_k . So, these particular symbols we are going to write down just to write in a very compact form.

So, let us see how to write down this particular thing in a very compact form.

(Refer Slide Time: 26:00)

Kinetic energy of the particle having differential mass dm

$$dK_i = \frac{1}{2} (\dot{x}_i^2 + \dot{y}_i^2 + \dot{z}_i^2) dm = \frac{1}{2} T_r \left(\begin{matrix} 0 & 0 & 0 \\ \dot{x}_i & \dot{y}_i & \dot{z}_i \end{matrix} \right)^T dm$$

where T_r : Trace of a matrix

$$dK_i = \frac{1}{2} T_r \left[\sum_{a=1}^i U_{ia} \dot{q}_a \dot{r}_i \left[\sum_{b=1}^i U_{ib} \dot{q}_b \dot{r}_i \right]^T \right] dm$$

$$= \frac{1}{2} T_r \left[\sum_{a=1}^i \sum_{b=1}^i U_{ia} \dot{r}_i^{-1} U_{ib} \dot{q}_a \dot{q}_b \right] dm$$

$$= \frac{1}{2} T_r \left[\sum_{a=1}^i \sum_{b=1}^i U_{ia} \left(\dot{r}_i^{-1} \right) U_{ib} \dot{q}_a \dot{q}_b \right]$$

Handwritten notes on the right side of the slide show a velocity vector $\vec{v} = [\dot{x}_i, \dot{y}_i, \dot{z}_i]^T$ and its dot product with itself: $\dot{x}_i^2 + \dot{y}_i^2 + \dot{z}_i^2$.

Now, kinetic energy of the particle having the differential mass is nothing but half mv square. Now here the mass of this particular differential mass is dm . So, half $dm v$ square now here this particular velocity, which is a vector has got 3 components. So, this particular components velocity has got your 3 components like say x_i dot then comes your y_i dot and z_i dot. So, these are the 3 components of this particular the velocity ok

Now here, so this the kinetic energy of the differential mass dm the small particle that is dK_i is nothing but half dm , then x_i dot square plus y_i dot square plus z_i dot square. Now this V bar that is nothing but a V_i with respect to 0 is nothing but this and now this V_i with respect to 0 trace of that. So, this is nothing but a 3 cross 1 matrix and I can write down actually here like its trace is nothing but x_i dot y_i dot then comes your z_i dot now here if I just multiply.

So, I will be getting your first row first column that is x_i dot square x_i dot square, then first row second column x_i dot y_i dot then comes your z_i dot x_i dot then y_x . So, I will be getting x_i dot y_i dot then comes your y_i dot square then comes your y_i dot z_i dot, then

comes your z_x that is $z_i \dot{x}_i$ dot then comes your $y_i \dot{z}_i$ dot and then comes your $z_i \dot{z}_i$ dot square.

So, this type of like 3 cross 3 matrix we will be getting. Now here we try to concentrate only on the diagonal elements and this diagonal elements is nothing but trace of this particular the matrix ok. So, $x_i \dot{x}_i$ dot square plus $y_i \dot{y}_i$ dot square plus $z_i \dot{z}_i$ dot square and that is a actually nothing but trace of. So, trace of. So, this particular V_i with respect to 0, V_i with respect to 0 transpose. So, trace of that is nothing but $X_i \dot{x}_i$ dot square plus $Y_i \dot{y}_i$ dot square plus $Z_i \dot{z}_i$ dot square dm .

Now, this dK_i is nothing but your half trace of this v_i with respect to 0 now we have already derived that V_i with respect to 0 is nothing but summation a equals to 1 to i $U_{ia} \dot{q}_a$ dot r_i with respect to I this I have already seen and then. So, this particular V_i with respect to 0 T' prime this is nothing but is your summation b equals to 1 to i $U_{ib} \dot{q}_b$ dot r_i with respect to i trace of that dm . Now here, I one thing I just want to mention now here this summation I have taken a equals to one to i . And here I have taken a v equals to 1 to i and this I have done very purposefully; for example, say if I consider. So, it is a rotary joint.

(Refer Slide Time: 30:09)

Kinetic energy of the particle having differential mass dm

$$dK_i = \frac{1}{2} (\dot{x}_i^2 + \dot{y}_i^2 + \dot{z}_i^2) dm = \frac{1}{2} T_r \left(\begin{matrix} 0 & 0 & 0 \\ i & V & V \\ & & T' \end{matrix} \right) dm$$

where T_r : Trace of a matrix

$$dK_i = \frac{1}{2} T_r \left[\sum_{a=1}^i U_{ia} \dot{q}_a \dot{r}_i \left[\sum_{b=1}^i U_{ib} \dot{q}_b \dot{r}_i \right]^{T'} \right] dm$$

$$= \frac{1}{2} T_r \left[\sum_{a=1}^i \sum_{b=1}^i U_{ia} \dot{r}_i^{i-T'} U_{ib}^{T'} \dot{q}_a \dot{q}_b \right] dm$$

$$= \frac{1}{2} T_r \left[\sum_{a=1}^i \sum_{b=1}^i U_{ia} \left(\dot{r}_i^{i-T'} \right) U_{ib}^{T'} \dot{q}_a \dot{q}_b \right]$$

Handwritten notes on the slide include a circled matrix of $\theta_{1,2}$ and $\theta_{2,3}$ with a $\dot{\theta}_1$ next to it.

IIT KHARAGPUR | NPTEL ONLINE CERTIFICATION COURSES

So, in place of this $q_a \dot{I}$ I am just going to write down $\theta_a \dot{I}$ and in place of this $q_b \dot{I}$ I am just going to write down like $q_b \dot{I}$. Now if you see the final expression which I am going to derive. So, there is a possibility there will be a few terms like $\theta_1 \dot{I}$

multiplied by θ_2 then might be θ_2 multiplied by θ_3 something like this ok. Now if I do not consider the separate range for this particular summation. So, I am just going to miss this particular the combination of θ_1 multiplied by θ_2 .

Now, if I consider both a equals to 1 to i and b equals to 1 to i . So, there is a possibility I will be getting θ_1 square. Now for a very special case I will be getting θ_1 square and where a will become equals to b , but just to keep this particular possibility alive. So, I have taken 2 separate range for this particular the summation. Now, once you have written a like this we can rearrange in this particular format half trace summation a equals to 1 to i summation b equals to 1 to i U i r i with respect to i , r i with respect to i transpose.

Then comes U i be a transpose then q a dot q b dot d m this can be further rearranged in this particular format half trace summation a equals to 1 to i , summation b equals to 1 to i , q a q i a . Then, this r i with respect to i d m , r i with respect to I transpose of that then U i b transpose q a dot q b dot. So, it can be rearranged in this particular the format.

Thank you.
