Shocks in C-D Nozzles (cont'd)

(Refer Slide Time: 00:21)

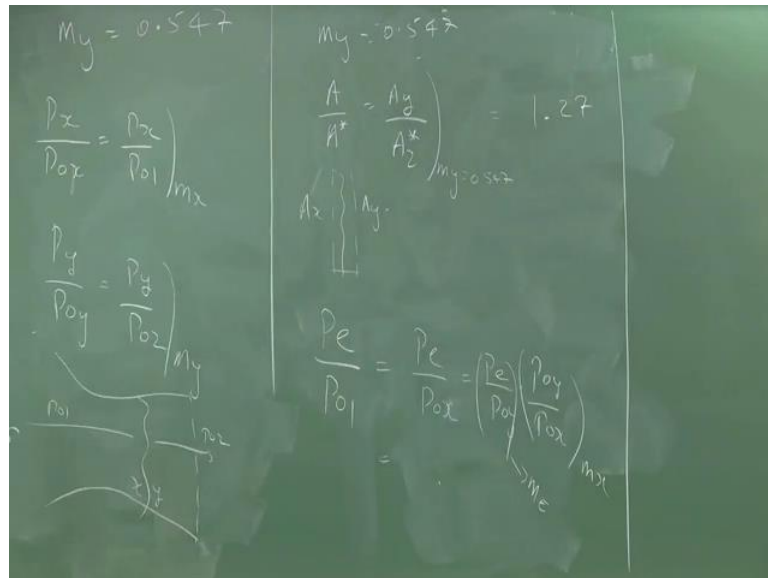

I have a nozzle where my A_{exit} by A_{throat} is 2 and there is this 3, there is a shock sitting at some location where my area ratio is 2, find P_e by P_{01} ? So, I have a P_0 I have a P_{exit} , now after the shock it is going to be subsonic, this can also be your P_b . So, the pressure ratio P_{exit} to P_0 that is what we need to find. All that is given is this area ratio nothing else, from this area ratio you have to find your pressure ratio P_e by P_{exit} again.

We start from the information we have there is a shock diverging section implies A_{throat} is your $A_{star 1}$ which is your A_{star} , throat is choked $M_{throat} = 1$. So, whatever pressure you would have P_{01} is same as your P_{0x} then it encounters a shock you use some of your stagnation pressure which would be retained till the exit.

Now, you are given A_x by A_t which is also A_x by A_{star} . So, this is $A_{star 1}$ because that is something that is happening before the shock, so we call this as this; this is 2. So, the

mach number associated with A_x equals 2 is, I look at the isentropic tables find A_x by $A_{star 2}$ will give me a mach number of 2.2, mach number of around 2.2. Now the shock is happening at M_x equals 2.2.

(Refer Slide Time: 04:38)

So, your M_y equals this is from isentropic tables, now M_y is I look at the shock tables for mach number 2.2; M_y is 0.547. So, I have M_y that is generated at this. So, your P_x by P_{0x} is P_x by P_{01} at m_x and your P_y by P_{0y} is your P_y by P_{02} or P_{02} exist at M_y . So, what I would written here is have a shock and then this is x, this is y, if that is your value this is my P_{02} this is my P_{01} which is constant up to the shock and constant after the shock, that is one information.

Second information, I can get A_y by after the shock I have m_y equals 0.545 which implies my A by A_{star} associated with this is my A_y by A_{2^*} , A_y star or A_{2^*} star. But in the shock derivation we have taken the control volume around the shock and we have assumed A_x equals A_y . So, this I can get it for M_y equals 0.74 which is I look at the isentropic tables I get A by A_{star} is a 0.547, A by A_{star} is on the around 1.27.

Now I know my A_x , I need to find P_{exit} by P_{01} which I can rewrite it as P_{exit} by P_{0x} , which is P_{exit} into P_{0y} into P_{0y} by P_{0x} into P_{0x} , I can rewrite the P_{0x} in this

particular form. So, I know this pressure ratio P_{exit} by P_{01} as P_x into P_{0x} into P_{exit} I rewrite in this particular form. This is associated with my m_x this is associated with my m_{exit} , if there is a shock and if there is a pressure that is here. So, I need to find my m_{exit} . So, if I know my m_{exit} I can find this ratio and that multiplied by this should give me the pressure ratio.

(Refer Slide Time: 09:35)

Handwritten mathematical derivations on a chalkboard:

- Left side: $\frac{P_{02}}{P_{01}} \Big|_{m_x}$, $\frac{P_{02}}{P_{02}} \Big|_{m_y}$, $\frac{P_{01}}{P_{02}} \Big|_{m_x}$
- Middle section: $m_y = 0.547$, $\frac{A}{A^*} = \frac{A_2}{A_2^*} \Big|_{m_y=0.547} = 1.27$, A_x , A_y , $\frac{P_e}{P_{01}} = \frac{P_e}{P_{02}} = \left(\frac{P_e}{P_{02}} \right) \left(\frac{P_{02}}{P_{01}} \right) \Big|_{m_x}$
- Right side: "to find M_2 ", $\frac{A_2}{A_2^*} = \frac{A_2}{A_2^*} \cdot \frac{A_2^*}{A_1^*}$, $\frac{A_2}{A_2^*} = \frac{A_2}{A_1} \cdot \frac{A_1}{A_1^*}$, $= \frac{A_2}{A_1} \cdot \frac{A_1}{A_1^*} \cdot \frac{A_1^*}{A_1}$, $= 3 \times \frac{1}{2} \times 1.27$, $= 1.9$, $M = 0.32$ OR 2.15

Now, there is something to find M_{exit} I need to find A_{exit} by A_{exit} star which is nothing but, what is we called it as A_2 by A_2 star, A_2 star is also is my A_y star. So, I need to find A_2 by A_y star which I can rewrite it as A_2 by A_y into A_y by A_y star, I can write it as A_2 by A_1 into A_1 by A_y into A_y by A_y star. So, I need to find A_{exit} by A_{exit} star, so I replace this A quantity in terms of quantities I know.

So, A_2 by A_1 is already given which is A_2 by A_1 is A_{exit} by A_1 is I thought so, I will write this as my throat area, I divide it by throat area. So, A_2 by A_2 by A_{throat} area and A_{throat} area by A_y and A_y by A_y star. So, A_2 by A_{throat} area is our area ratio which is 3 and A_{throat} by A_y is the location where your shock is happening which is given as 2, it is 1 by 2 into A_y by A_y star we already have found based on my M_y which is 1.27. So, this is my A_{exit} by A_{exit} star which is.

Student: (Refer Time: 12:00).

1.9. So, your M associated with this 1.9 is, look at the isentropic table 1.9 this subsonic value. So, we will write both, or.

Student: (Refer Time: 12:58).

2.1, around 2.15, now we are talking about A section which is after the shock. So, the supersonic solution cannot happen there it is always subsonic flow. So, this is our M exit. So, your P by P 0 corresponding to 0.35 is your value that has to be substituted here.

(Refer Slide Time: 13:43)

So, your P exit by P 01 is P exit by P 0 y into P 0 y by P 01. So, this is corresponding to M equal 0.35 which is our M exit, this is your corresponding to your m x which is before the shock, these 2 values should give me the pressure ratio. So, M equals 3.5 my P exit by P e is 0 is 0.918 multiplied by, I look at the shock tables m is m x equals m x equals 2.2, 2.2 P 0 y by P 0 x is 0.628 this is equals 2.2. So, this is form shock tables, this is from isentropic tables; this is around.

Student: point five (Refer Time: 15:14).

0.756.

Student: 0.576.

0.576. So, that is my P_{exit} by P_{01} . So, if I have this pressure ratio; you come back to the question if I have that pressure ratio P_{exit} by P_{01} is 0.576 I will have shock at a location where you have this. So, if your P_0 is; let us put say P_{exit} some value then the ratio would be this. So, your let us take P_0 as say 100 kilopascal, your P_{exit} is 57.8 kilopascal, 57.8 kilopascal is a region between $P_{critical 1}$ and $P_{critical 2}$. So, there is a shock in the diverging section, and that happens at a location where area ratio is 2.

The key is, you consider shock as the non isentropic process everywhere else it is a isentropic process, and what all be the case before and after if I have a long depth you do not need have the C-D nozzle information where the shocking condition or throat condition is not there. But if it is a nozzle you have this condition.

Same is true for a diverging diffuser. So, if I have a diverging portion, if I do not consider this portion and I have a diffuser and there is shock sitting here you do the same kind of analysis and get the tables to do the problems the values before the shock and after shock and this normal shock tables for the properties across the shock. And that should solve the entire shock problem, now (Refer Time: 17:47) standing normal shock problem.

Thank you.
