Tutorial – 6
Chemical potential**

Welcome in this tutorial, suppose you take free energy versus composition curve and if you draw a tangent to this curve at any point, the intercepts on the pure A and pure B, access along the Y-axis, basically give you the chemical potential, this is what we want to prove, so to prove that, so again we have going to use some the definition of chemical potential and some trigonometry to prove this, so let us start with the definition of chemical potential.

(Refer Slide Time: 00:50)

The image shows handwritten mathematical derivations on a whiteboard. The equations are as follows:

$$\mu_A = \left(\frac{\partial G'}{\partial n_A} \right)_{T, P, n_B}$$
$$\mu_B = \left(\frac{\partial G'}{\partial n_B} \right)_{T, P, n_A}$$
$$dG' = \mu_A dn_A + \mu_B dn_B$$
$$\frac{dG'}{n_A + n_B} = \mu_A \frac{dn_A}{n_A + n_B} + \mu_B \frac{dn_B}{n_A + n_B}$$

There is a small note $n_A + n_B$ written to the right of the second equation. A small red circular logo is visible in the bottom left corner of the whiteboard image.

So what is μ_a we define μ_A as the free energy change, for changing the number of A atoms, but by keeping everything else a constant, this G , is there because g represents the total free energy of this system, okay, similarly μ_B is defined as, how much does the free energy change? When you change a number of B atoms by keeping all the other quantities a constant.

In other words you can write that the free energy of given system is nothing but $\mu_A dn_A + \mu_B dn_B$, okay now $n_A + n_B$, okay so let us take this quantity $n_A + n_B$, and let us divide this by $n_A + n_B$, this is dG , that is dn_A, dn_B , this is the change in the free energy, total free energy, so if I divide this by $n_A + n_B$, is nothing but $\mu_A dn_A / n_A + n_B$ and this is $\mu_B dn_B / n_A + n_B$, so why are we doing this? Because then you can define this quantity $dn_A / n_A + n_B$, as dx_A . Okay so that is the reason why we are doing this. So from this expression we have.

(Refer Slide Time: 02:24)

The image shows a whiteboard with the following handwritten equations and notes:

$$dG = \mu_A dx_A + \mu_B dx_B$$

$$\frac{dG}{dx_B} = \mu_A \frac{dx_A}{dx_B} + \mu_B$$

$$\frac{dG}{dx_B} = -\mu_A + \mu_B$$

$$G = \mu_A x_A + \mu_B x_B$$

$$\mu_B = \frac{G - \mu_A x_A}{x_B}$$

Additional notes on the right side of the board:

$$x_A + x_B = 1$$

$$dn_A : dn_B = x_A : x_B$$

dG , this is free energy per mole, because $n_A + n_B$, I have find so $\mu_A dx_A + \mu_B dx_B$, this is what we have, now from this suppose if i want to get dG/dx_B , what is the quantity this is $\mu_A dx_A/dx_B + \mu_B$, but dx_A should be equal to $-dx_B$, because $x_A + x_B = 1$, why because $n_A + n_B$, and so, x_A is $n_A / n_A + n_B$, x_B is $n_B / n_A + n_B$ so you put up together you get this.

So $dx_A = -dx_B$, in other words you have this property, $dg/dx_B = -\mu_A + \mu_B$, okay so this is one expression, now we can also write $G = \mu_A x_A + \mu_B x_B$, now where does this come from? See you

can see this expression, okay suppose if I change the number of atoms in the system, but I change them in the proper proportion, okay so I change it by one mole, but that one mole is given by x_{AA} Atoms, and x_{BB} atoms, so that is what makes it one moles and then you can see that if the $dn_A : dn_B$ is in the same ratio as $X_A : X_B$.

I won't have change the composition of the system but I would have change the free energy, and because g is a energy per mol, then you get this expression, so from here it is clear that what is a μ_B it is $g - \mu_A X_A / X_B$ so this is another expression. Now dG/dX_B is $-\mu_A + \mu_B$, and I can put this expression for μ_B here so I get dG/dx_B , as follows, so i get the expression Dg/dx_B .

(Refer Slide Time: 4:49)

The image shows a whiteboard with the following handwritten equations:

$$\frac{dg}{dx_B} = -\mu_A + \frac{G - \mu_A X_A}{x_B}$$

$$x_B \frac{dg}{dx_B} = -\mu_A x_B + G - \mu_A X_A$$

$$= -\mu_A (x_B + X_A) + G$$

The final equation is boxed:

$$\mu_A = G - x_B \frac{dg}{dx_B}$$

So $dG/dx_B = -\mu_A + G - \mu_A X_A / X_B$, okay so now let me take $X_B dG/dx_B$ is nothing but $-\mu_A x_B + G - \mu_A X_A$ and so I can write this so i can pull out $-\mu_A$ then $(x_A + x_B) + G$, and so this is 1, so that means what μ_A is nothing but $G - x_B dG/dx_B$, okay, so now let me consider a free energy versus composition diagram and the diagram looks like this

(Refer Slide Time: 5:48)

So I have free energy versus composition diagram, okay I have some point p, at that point “p” I am going to draw a common tangent a tangent to the curve and let us say R is the point at which it happens, and let us draw a line parallel to x- axis, and let us the join the curve that is joining PR cuts this horizontal line at Q.

Let us say, let we call this point as S this point as O which is pure A point, and this is P and this is T, so okay this is pure A and this is pure B, so I have this point to OPT, then SQU, and then SRV, okay now we have define them μ_A , as nothing but $G - x_B dG/dx_B$ right, so now what is this quantity, let us look at G, what is this so PR, is nothing but G, that is the free energy curve so PR is $G - x_B dG/dx_B$ is basically the slope, so that is nothing but RQ/SQ right? RQ/SQ, but SQ is nothing but AP which is nothing but x_B itself, so this is equal to x_B .

So this is going to go, so you are going to get PR-RQ, so PR-RQ, is basically the intercept S, right? PR-RQ, so it’s basically PQ, which is nothing but OS, another words μ_A geometrically is nothing but the tangent curve where it cuts the pure A axis, that is basically the, so its extrapolation of the tangent at x_B composition to the A line right. In a similar fashion you can also try to define μ_B , from the earlier expression we know that, μ_B is nothing but okay so let us take μ_B , so what is μ_B ? μ_B is nothing but

(Refer Slide Time: 09:02)

$\mu_A + \mu_B Dg/dx_B$, okay so this is one of the expressions that we derived earlier, so μ_B is nothing but $\mu_A + dG/dx_B$, μ_A just now we proved is equal to $OS + dG/dx_B$, so this is the what is dG , and that is UV okay, by dx_B nothing but US on the curve but that is the entire distance on the curves, so that is equal to 1, so $OS = UV$, so $OS + UV$ that is nothing but TV , on the curve.

So in other words μ_B is nothing but extrapolation to the B line of the tangent right? so this is $OS + UV$ is nothing but TV , because TU and OS are the same, because this is the horizontal line, so you get so in other words what we have proved? Is that U can take the free energy versus composition curve at any point you draw a tangent, wherever the tangents cut the A axis, that is $x_B = 0$ is basically the chemical potential, for A.

And wherever it cuts the other axis B, which is $x_B = 1$, is basically the chemical potential for B, okay so this is what we want to prove in this tutorial that you can take a free energy versus composition curve at any point you can take a tangent and then, extrapolate the tangent to the pure A and pure B line, and the intercept basically gives you the chemical potential, for that composition in this system, okay so that is what we have prove, and that is what we want to prove, thank you.
