Grover's Search Algorithm – IV

In the last three lectures we have been talking about Grover's search algorithm and what we have pointed out is that this is a problem requires of the order of  $n$  searches.

(Refer Slide Time: 00:26)

In an unstructured database to locate a particular item the schematic diagram of the Grover oracle is here that the oracle computes a function of  $x$  which is a  $n$  cubic string and when they string exactly matches certain such condition that is it exactly matches a marked stage, the function evaluates to 1 otherwise the function becomes equal to 0.

(Refer Slide Time: 01:01)

**Quantum Information and Computing**  
**Grover Oracle**

- If  $y = \frac{|0\rangle - |1\rangle}{\sqrt{2}}$ , the output can be written as  $(-1)^{f_w(x)} |x\rangle \otimes \frac{|0\rangle - |1\rangle}{\sqrt{2}}$
- The second register is unaltered but the first register has a phase depending on  $f_w(x)$ . If  $f_w(x) = 1$ , the sign of the first register is flipped.

Prof. P. K. Ghosh, Department of Physics, IIT Bombay

What we have seen is that we start with a linear combination of the computational bases state as the input the target is set to  $0-1/\sqrt{2}$  which is obtained by passing a qubit 1 through a Hadamard gate and then we have found that when the target state is 0 just the out pout is the function itself when the target bit is 1 it is the complement of the function the state of the 1<sup>st</sup> and the 2<sup>nd</sup> register is given by this slide.

(Refer Slide Time: 01:37)

**Quantum Information and Computing**  
**Grover Operator**

- $|\langle w|s\rangle| = \frac{1}{\sqrt{N}}$
- Grover Rotation Operator is defined as  
$$R_G = U_s U_w$$
- For an arbitrary state  $|\psi\rangle = \sum_x a_x |x\rangle$ , the components about the mean get inverted, i.e.  $a_x \rightarrow 2\bar{a} - a_x$  which leads to selective amplification of the amplitude.

  
Prof. P.K. Ghosh, Department of Physics, IIT Bombay

Phase which is  $(-1)^{f_w(x)}$  is associated with the first register and the second register essentially unchanged, so the point is this, that if the phase happens to be equal to -1 and that happens to an we are at the marked state because that  $f_w(x) = 1$  then of course sign in the first register is skipped, we had defined two operators one  $U_w$  which is given by  $I - 2|w\rangle\langle w|$  and  $U_s$  which is two times the operator for the standard state  $2|s\rangle\langle s| - I$ .

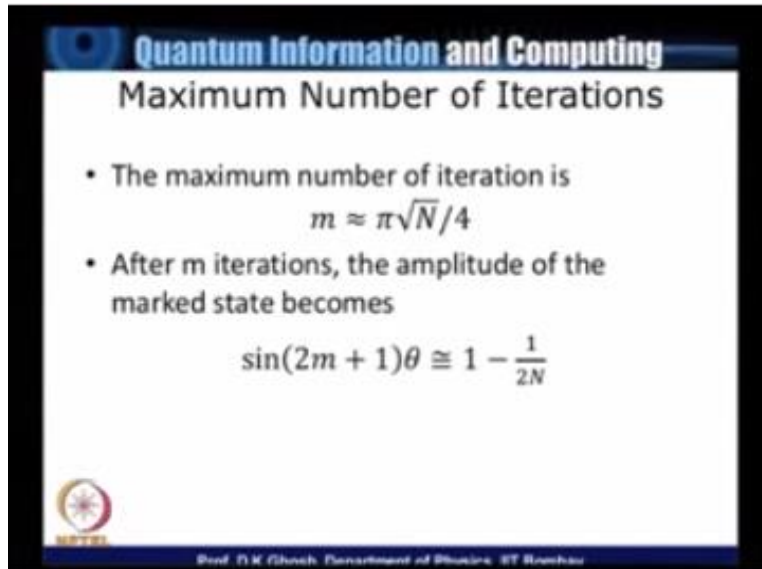

And then we had said that the Grover rotation operator is given by  $U_s$  times  $U_w$  and we had seen last time that when the Grover's operator acts on an arbitrary state  $\psi$  given by sum over  $x$   $a_x |x\rangle$ ,  $x$  is your computational bases,  $a_x$  is the amplitude of  $\psi$  in various computational base state, then we found that the components about the mean that divided inverter that is  $a_x$  goes to 2 times mean of  $a$ ,  $\bar{a}$  ( $-a_x$ ) which leads to selective amplification of the amplitude.

(Refer Slide Time: 03:05)

And we had worked it out for the case of a 3 qubit case and we had seen that if you meant two rotation Grover rotation than the marked state probability becomes 25 time the probability amplitude becomes 5 times that of the other computational bases.

(Refer Slide Time: 03:26)

**Quantum Information and Computing**

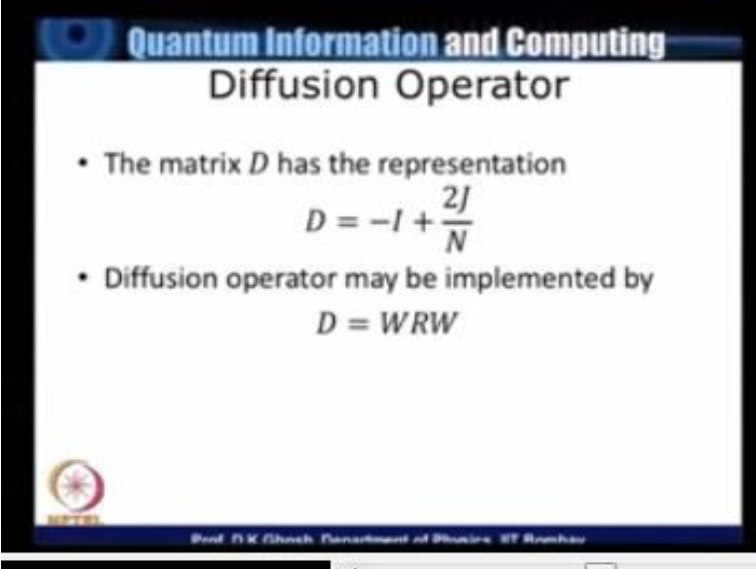

### Maximum Number of Iterations

- The maximum number of iteration is
$$m \approx \pi\sqrt{N}/4$$
- After  $m$  iterations, the amplitude of the marked state becomes
$$\sin(2m + 1)\theta \cong 1 - \frac{1}{2N}$$

Prof. D.K. Ghosh, Department of Physics, IIT Bombay

And this is the basic principle, behind locating a particular marked state, we had also shown that the maximum number of iteration is given by  $\pi$  times  $\sqrt{N}/4$  and after  $N$  iterations we found that the amplitude of the marked state becomes  $\sin(2m + 1)\theta$  where  $\theta$  is approximately equal to  $\sin \theta$  for large  $N$  and is given by  $1 - 1/2N$ .

(Refer Slide Time: 03:59)

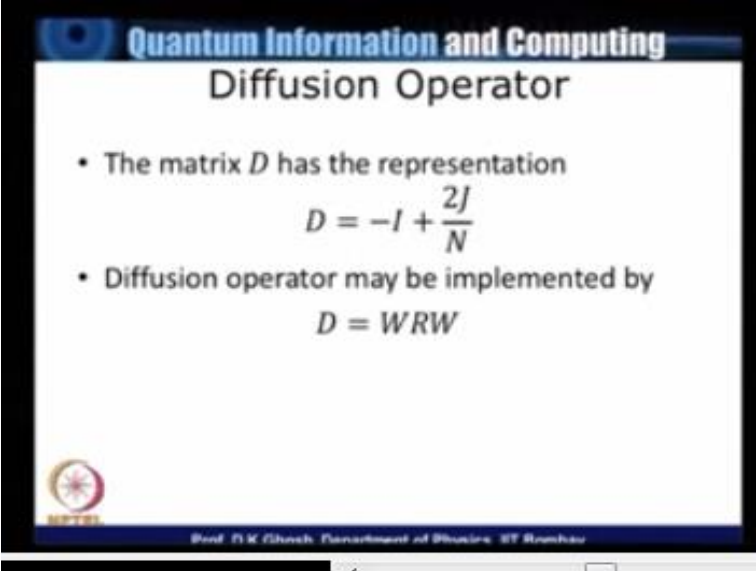

**Quantum Information and Computing**  
**Diffusion Operator**

- The matrix  $D$  has the representation
$$D = -I + \frac{2J}{N}$$
- Diffusion operator may be implemented by
$$D = WRW$$

Prof. P. K. Ghosh, Department of Physics, IIT Bombay

The last thing that we attempt its last time was to define a diffusion matrix and we said that diffusion matrix.

(Refer Slide Time: 04:09)

**Quantum Information and Computing**  
**Diffusion Operator**

- The matrix  $D$  has the representation
$$D = -I + \frac{2J}{N}$$
- Diffusion operator may be implemented by
$$D = WRW$$

Prof. P. K. Ghosh, Department of Physics, IIT Bombay

Is defined by  $-I + 2J/N$  and we made a statement though we did not prove that the reason for defining a diffusion matrix is that, that can be implemented by quantum circuit, consisting of  $WRW$  where  $W$  is the wall's Hadamard transform and  $R$  is a selective rotation.

(Refer Slide Time: 04:37)

**Quantum Information and Computing**  
**Algorithm Quality**

- Let  $|u\rangle$  denote the linear combination of all states for which  $f(x) = 0$ , i.e.  
$$|u\rangle = \frac{1}{\sqrt{N-1}} \sum_{x \neq w} |x\rangle$$
- The standard state is then  
$$|s\rangle = \frac{1}{\sqrt{N}} |w\rangle + \sqrt{\frac{N-1}{N}} |u\rangle$$

Prof. D.M. Green, Department of Physics, ST. Bonaventure

So we will now look at how this actually works and let us will attempt to complete the Grover rotation tool.

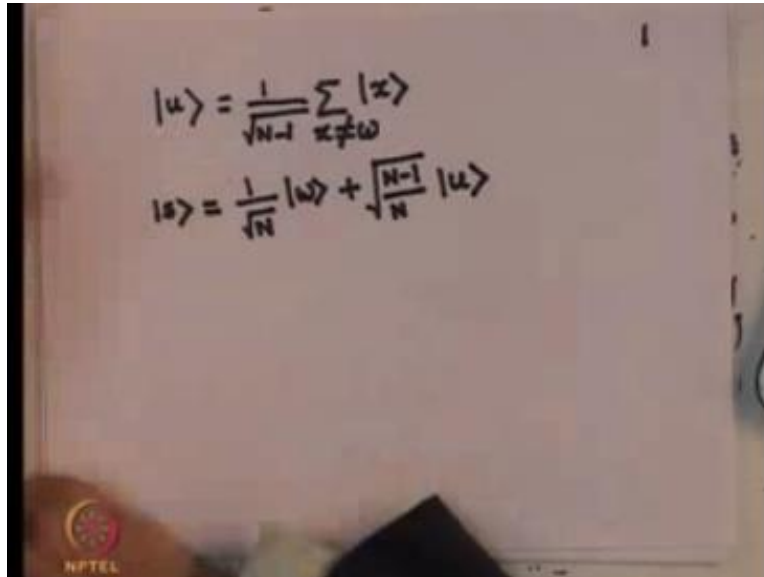

(Refer Slide Time: 04:47)

Suppose  $|U\rangle$  is a linear combination of all the members of the basis other than the particularly marked state that is which we called as the  $W$  for which  $f(x)$  evaluates to 0 rather than 1 which is what happens when  $x$  happens to be equal to  $w$ .

(Refer Slide Time: 05:13)

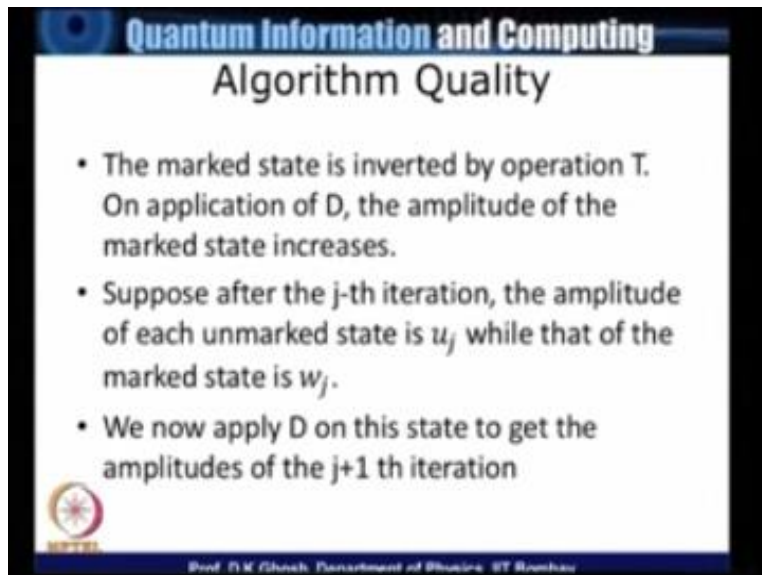

The image shows a whiteboard with two handwritten equations. The first equation is  $|u\rangle = \frac{1}{\sqrt{N-1}} \sum_{x \neq \omega} |x\rangle$ . The second equation is  $|s\rangle = \frac{1}{\sqrt{N}} |\omega\rangle + \sqrt{\frac{N-1}{N}} |u\rangle$ . There is a small '1' written in the top right corner of the whiteboard. An NPTEL logo is visible in the bottom left corner.

Then I define  $U$  because it has a  $N-1$  number of items as  $1/\sqrt{N-1}$  sum over  $x$  but then in this case is not equal to  $W$  of the computational basis  $x$ , so this is not quite the standard state but it differs from the standard state in the sense that one of the items there is missing, so as a result my standard state because its normalization is  $1/\sqrt{N}$  so this is simply given by  $1/\sqrt{N} |W\rangle + \sqrt{N-1}/N$  times  $|u\rangle$ .

Remember we have two types of operations there one we called a the deep which acting on the states inverse the marked state, that is the marked state amplitude picks up the minus sign.

(Refer Slide Time: 06:16)

**Quantum Information and Computing**  
**Algorithm Quality**

- The marked state is inverted by operation T. On application of D, the amplitude of the marked state increases.
- Suppose after the  $j$ -th iteration, the amplitude of each unmarked state is  $u_j$  while that of the marked state is  $w_j$ .
- We now apply D on this state to get the amplitudes of the  $j+1$  th iteration

Prof. D.K. Ghosh, Department of Physics, IIT Bombay

And after that we will apply the which has the effect of selectively increasing the amplitude of the marked state, so we said that suppose after  $J^{\text{th}}$  iteration.

(Refer Slide Time: 06:29)

$$|u\rangle = \frac{1}{\sqrt{N-1}} \sum_{x \neq w} |x\rangle$$

$$|s\rangle = \frac{1}{\sqrt{N}} |w\rangle + \sqrt{\frac{N-1}{N}} |u\rangle$$

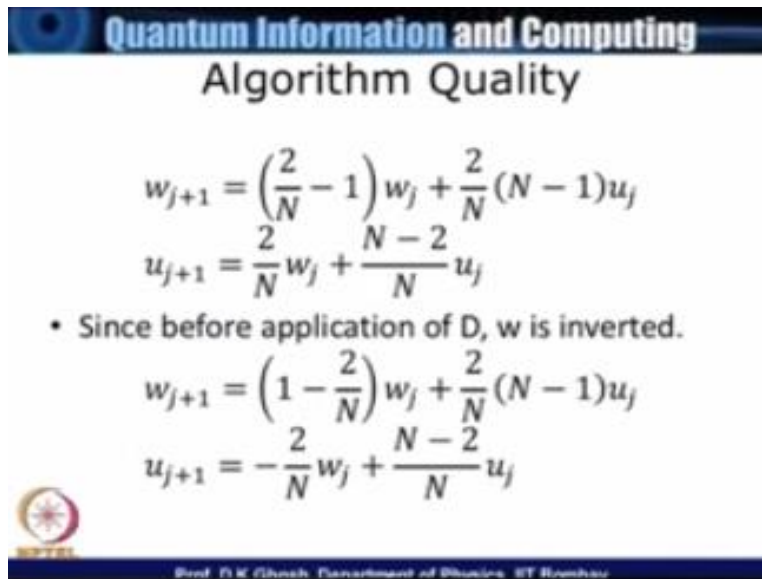

*j*<sup>th</sup> iteration

$$\begin{pmatrix} u_{j+1} \\ u_{j+1} \\ \vdots \\ u_{j+1} \end{pmatrix} = - \begin{pmatrix} u_j \\ u_j \\ \vdots \\ u_j \end{pmatrix} + \frac{1}{2} \begin{pmatrix} 1 & \dots & 1 \\ \vdots & \ddots & \vdots \\ 1 & \dots & 1 \end{pmatrix} \begin{pmatrix} u_j \\ u_j \\ \vdots \\ u_j \end{pmatrix}$$

Suppose after  $J^{\text{th}}$  iterations the amplitude of the unmarked state is  $U_j$  and that of the marked state is  $w_j$  now we would be interested in knowing what happens when you apply  $D$  on such a state? So what is the result of the  $J + 1^{\text{th}}$  iteration? Why you will do it as this that remember that if I write this define each one of the unmarked state as  $u$ , so I will call  $u_{j+1}$ ,  $u_{j+1}$  I do not distinguish between 1,2,3,4 for the simple reason that each of the unmarked state has the same amplitude. But I have a  $w_{j+1}$  which is what changes and then of course  $u_{j+1}$  also, so this is equal to. Now  $-I$ , so therefore  $-u_j$ ,  $u_j$  extra up to  $W_j$  and then again everything is  $u_j + 2/N_j$  if you recall my  $j$  was a matrix which has each element equal to 1.

And this then you multiples my  $u_j$ s the, the  $j^{\text{th}}$  iteration values which is  $W_j$  extra. Now this is a fairly simple matrix multiplication to work out and the reason you see is this, because each element is 1, the sum of the column factor here, they all becomes  $n-1$  times  $u_j$  and they are plus of course  $W_j$ , so then if I equate, if I equate the elements of a matrix because this will becomes a matrix equation, I essentially get two types of equations, the equations differ in the following way.

(Refer Slide Time: 08:50)

**Quantum Information and Computing**  
**Algorithm Quality**

$$w_{j+1} = \left(\frac{2}{N} - 1\right)w_j + \frac{2}{N}(N-1)u_j$$
$$u_{j+1} = \frac{2}{N}w_j + \frac{N-2}{N}u_j$$

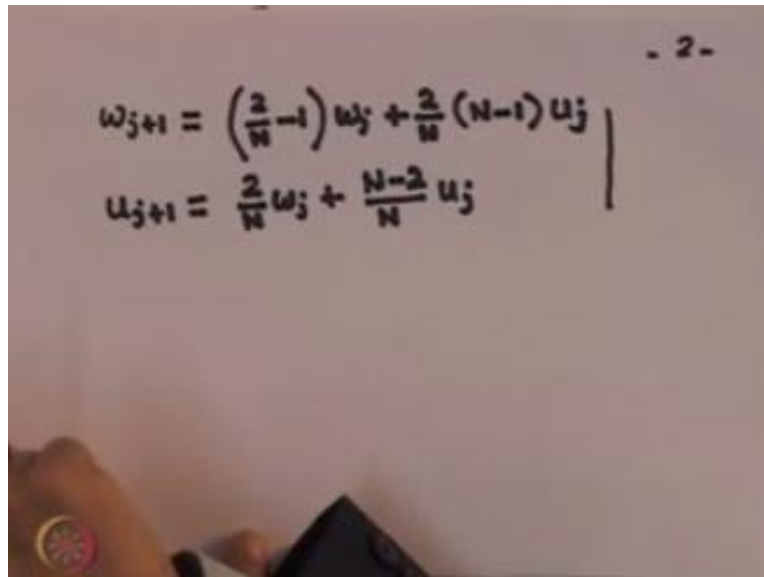

- Since before application of D, w is inverted.

$$w_{j+1} = \left(1 - \frac{2}{N}\right)w_j + \frac{2}{N}(N-1)u_j$$
$$u_{j+1} = -\frac{2}{N}w_j + \frac{N-2}{N}u_j$$

Prof. P. K. Ghosh, Department of Physics, IIT Bombay

That is if you look at the slide the first equation is.

(Refer Slide Time: 08:58)

A photograph of a whiteboard with handwritten mathematical equations. The equations are:

$$\omega_{j+1} = \left(\frac{2}{N}-1\right)\omega_j + \frac{2}{N}(N-1)u_j$$
$$u_{j+1} = \frac{2}{N}\omega_j + \frac{N-2}{N}u_j$$

The equations are enclosed in a large right-facing curly bracket. In the top right corner of the whiteboard, there is a small handwritten mark that looks like "- 2 -".

$W_{j+1}$  is equal to, now you notice that I have got  $(2/N-1)$  acting on  $W_j+2/N(N-1)$  because there are  $N-1$  of those  $u$  is  $u_j$  and  $u_{j+1}$  is  $2/N W_j+N-2/N$  times  $u_j$ , so this is a simple way of just adding up the elements of a matrix and equating them. Now the only thing that we would like to comment here is this, there is a pair equation which you would like to solve, that you recall that before I calculated the  $j^{\text{th}} + 1^{\text{th}}$  I can, I had inverted the  $j^{\text{th}}$  value of  $W_j$  and that is because I had calculated  $W_j$  from  $j-1^{\text{th}}$  iteration and whatever value I got I had made it negative. So therefore, in order to relate to the previous value of  $W_j$  what we need to do is to invert the  $W_j$  in this equation so that I get

(Refer Slide Time: 10:29)

$$\begin{aligned} w_{j+1} &= \left(\frac{2}{N}-1\right)w_j + \frac{2}{N}(N-1)u_j \\ u_{j+1} &= \frac{2}{N}w_j + \frac{N-2}{N}u_j \end{aligned} \quad \left. \begin{array}{l} \\ \\ \end{array} \right\} \begin{array}{l} \\ \\ \end{array}$$
$$\begin{aligned} w_{j+1} &= \left(1-\frac{2}{N}\right)w_j + \frac{2}{N}(N-1)u_j \\ u_{j+1} &= \frac{2}{N}w_j + \frac{N-2}{N}u_j \end{aligned}$$

$W_{j+1} = (1-2/N) W_j$  instead of  $2/N-1$  and of course the other term simply remains the way it was  $2/N(N-1)u_j$  and  $u_{j+1}$  becomes equal to  $-2/NW_j + (N-2)/N u_j$ , so this the pair of equation that I need to solve. In order to be back let me introduce simplification is actually fairly straightforward equation. So what I do is this instead of solving for  $u_j$  let me define.

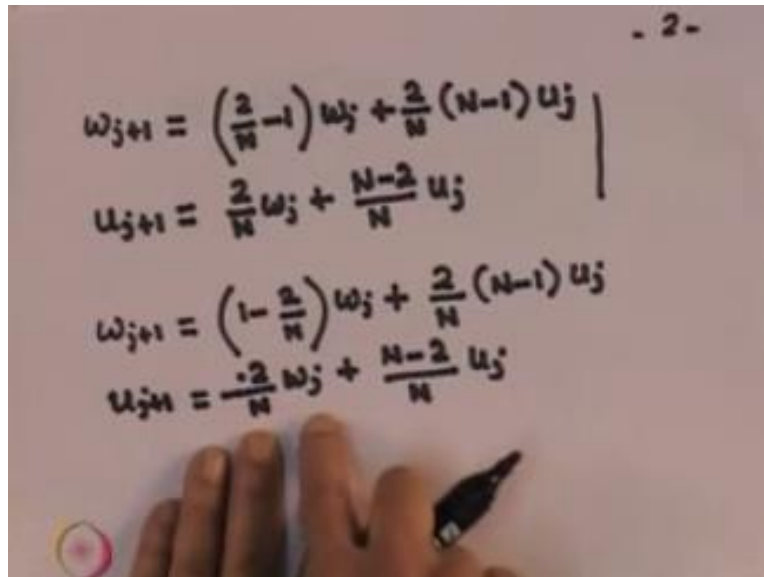

(Refer Slide Time: 11:18)

$$c_j = \sqrt{N-1} u_j$$

(Refer Slide Time: 11:26)

The image shows a whiteboard with handwritten mathematical equations. At the top right, there is a small mark that looks like "- 2 -". The equations are:

$$\omega_{j+1} = \left(\frac{2}{N}-1\right)\omega_j + \frac{2}{N}(N-1)u_j$$
$$u_{j+1} = \frac{2}{N}\omega_j + \frac{N-2}{N}u_j$$
$$\omega_{j+1} = \left(1-\frac{2}{N}\right)\omega_j + \frac{2}{N}(N-1)u_j$$
$$u_{j+1} = \frac{2}{N}\omega_j + \frac{N-2}{N}u_j$$

A hand is visible at the bottom of the whiteboard, holding a black marker.

So basically if you look back at this equation I notice that this  $u_j$  will be written as  $c_j/\sqrt{N-1}$  that will sort of make the numerator here  $\sqrt{N-1}$  times  $c_j$  and likewise in this equation also I will simply multiply both sides with  $\sqrt{N-1}$  and that will make this is an equation  $c_j$  and  $W_j$ .

(Refer Slide Time: 11:52)

$$c_j = \sqrt{N-1} u_j$$

$$\begin{pmatrix} w_{j+1} \\ c_{j+1} \end{pmatrix} = \begin{pmatrix} 1 - \frac{2}{N} & \frac{2}{N} \sqrt{N-1} \\ -\frac{2}{N} \sqrt{N-1} & 1 - \frac{2}{N} \end{pmatrix} \begin{pmatrix} w_j \\ c_j \end{pmatrix}$$

$$\frac{1}{\sqrt{N}} = \sin \theta, \quad \cos \theta = \sqrt{1 - \frac{1}{N}}$$

$$\begin{pmatrix} w_{j+1} \\ c_{j+1} \end{pmatrix} =$$

$$\begin{aligned} \sin 2\theta &= 2 \times \frac{1}{\sqrt{N}} \times \frac{\sqrt{N-1}}{\sqrt{N}} \\ &= \frac{2}{N} \sqrt{N-1} \end{aligned}$$

And the equations that I get then will be written as a  $2 \times 2$  matrix equation which is  $w_{j+1} c_{j+1}$  equal to let me write it as a matrix  $1 - 2/N$  and this is  $2/N$  times  $\sqrt{N-1}$  that is because I have defined in terms of  $c_j$  rather than  $u_j$   $-2/N\sqrt{N-1}$  and here  $1 - 2/N$  this with  $w_j c_j$ . Now this is a matrix which I will be able to solve easily and let see how. Recall that we have said that  $1/\sqrt{N}$  is  $\sin\theta$  that gives me  $\cos\theta = \sqrt{1 - 1/N}$ , so supposing I rewrite this equation in terms of  $\theta$  what I get is  $w_{j+1} c_{j+1}$  is equal to, now let us try to convert this, so if  $1/\sqrt{N}$  is  $\sin\theta$  and this is  $1 - 2/N$  you notice one thing I will just let me do the calculation on the side. Now what I get is  $\sin 2\theta$ ,  $\sin 2\theta$  is 2 times  $\sin\theta$  which is  $1/\sqrt{N}$ , times  $\cos\theta$  which can be written as  $\sqrt{N-1}/\sqrt{N}$  and that is equal to  $2/N$  into  $\sqrt{N-1}$ .

Which you notice is this of diagonal and minus of this of them so therefore let us I so this is  $\sin 2\theta$  this is  $-\sin 2\theta$  now let us complete what is  $\cos 2\theta$  the  $\cos 2\theta$  and we know is  $\cos^2\theta - \sin^2\theta$  so  $1 - 1/N -$  another  $1/N$  so  $= 1 - 2/N$  so therefore we will diagonal matrix element happens to the  $\cos 2\theta$ ,  $\cos 2\theta$  and of course we have the column matrix  $w_j$  and  $c$  now this should not have come has this apply to you the reason one what we are seeing here is that on application of Grover rotation they angle by  $\theta$  they it terms is twice the angle so this is exactly what happen that.  $w_{j+1}$  and  $w_j$  are related like this okay now in that case let us look at what is happening if you.

(Refer Slide Time: 15:35)

**Quantum Information and Computing**  
**Algorithm Quality**

$$w_{j+1} = \left(\frac{2}{N} - 1\right)w_j + \frac{2}{N}(N-1)u_j$$
$$u_{j+1} = \frac{2}{N}w_j + \frac{N-2}{N}u_j$$

- Since before application of D, w is inverted.

$$w_{j+1} = \left(1 - \frac{2}{N}\right)w_j + \frac{2}{N}(N-1)u_j$$
$$u_{j+1} = -\frac{2}{N}w_j + \frac{N-2}{N}u_j$$

Prof. R.K. Ghosh, Department of Physics, IIT Bombay

Applied this starting from the original value let say one so I would then get w so we have already worked out that  $w_j + 1$ .

(Refer Slide Time: 15:49)

The image shows a whiteboard with handwritten mathematical equations. The equations are:

$$\begin{pmatrix} w_{j+1} \\ u_{j+1} \end{pmatrix} = \begin{pmatrix} \cos 2\theta & \sin 2\theta \\ -\sin 2\theta & \cos 2\theta \end{pmatrix} \begin{pmatrix} w_j \\ u_j \end{pmatrix}$$
$$= \begin{pmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{pmatrix}^2 \begin{pmatrix} w_j \\ u_j \end{pmatrix}$$
$$=$$

A hand is visible in the foreground, holding a black marker and pointing towards the equations. The whiteboard has a small logo in the bottom left corner and the number '4' in the top right corner.

$U_{j+1}$  is  $= \cos 2\theta \sin 2\theta$  is just rotation matrix  $\sin 2\theta \cos 2\theta$   $w_j u_j$  now obviously I can go down in the change and so therefore what I would get is this matrix  $(\cos 2\theta \sin 2\theta - \sin 2\theta \cos \theta \cos 2\theta)^j$  acting on  $w_1$  and  $v_1$  now it is since these are rotation matrix I know that if I take a square that equivalent to increasing this angle from  $\theta$  to  $2\theta$  for this so every kind you multiply in it the rotation matrix the rotation matrix the factor the rotation matrix is to increase the rotation in this can we check.

(Refer Slide Time: 17:08)

$$\begin{aligned} \begin{pmatrix} u_{j+1} \\ v_{j+1} \end{pmatrix} &= \begin{pmatrix} \cos 2\theta & \sin 2\theta \\ -\sin 2\theta & \cos 2\theta \end{pmatrix} \begin{pmatrix} u_j \\ v_j \end{pmatrix} \\ &= \begin{pmatrix} \cos 2\theta & \sin 2\theta \\ -\sin 2\theta & \cos 2\theta \end{pmatrix}^j \begin{pmatrix} u_1 \\ v_1 \end{pmatrix} \\ &= \begin{pmatrix} \sin(2j+1)\theta \\ \cos(2j+1)\theta \end{pmatrix} \\ &= \begin{pmatrix} \cos 2\theta & \sin 2\theta \\ -\sin 2\theta & \cos 2\theta \end{pmatrix} \begin{pmatrix} \sin \theta \\ \cos \theta \end{pmatrix} \end{aligned}$$

By just multiplying to consequent values of the notes so therefore this one when we raise to the power  $j$  what we you find is remember that I have had to multiply this with that and all that so I will get  $\sin 2j + 1\theta$   $\cos 2j + 1\theta$  we have started with that remember why that  $+1$  comes if because our starting point was  $\sin \theta$   $\cos \theta$  in fact it is can be straight forward that suppose in would be one rotation we have  $\cos 2\theta$   $\sin 2\theta - \sin 2\theta$   $\cos 2\theta$  this is was  $\sin \theta$  this is  $\cos \theta$  so therefore  $\cos 2\theta$   $\sin \theta + \sin 2\theta$   $\cos \theta$  is  $\sin 3\theta$  and  $\sin 2\theta - \sin 2\theta - x$   $\sin \theta$   $\cos 2\theta$   $x$   $\cos \theta$  so that is  $\cos \theta$  yes trigonometric.

(Refer Slide Time: 18:21)

**Quantum Information and Computing**  
**Amplitude of marked state**

- Thus measurement of first register will give marked state with a probability  $\sin^2(2m + 1)\theta$

Prof. D.K. Ghosh, Department of Physics, IIT Bombay

So what we said is at this stage if I measure the first register I will get the marked state if the probability implicate if  $\sin$  of  $2N + 1\theta$  which means the probability is given by  $\sin^2$  of  $2N + 1$  now it is important that you realize that since we are oscillating function so if start with the small value of  $\theta$  I can gradually increase the  $\sin^2$  function tell me the  $\sin^2$  function has approached one or just about cross one after that your increasing the number iteration will not help between that make the condition works.

And that is what we pointed out several times that we will must have an a priori idea of how many times the Grover iteration should work and we have pointed out it is given by a number which is approximately  $\frac{5}{4} \times \sqrt{n}$ .

(Refer Slide Time: 19:33)

The slide displays the following content:

**Quantum Information and Computing**  
**Example : N=8**

•  $D = -I + \frac{2J}{N}$

$$= \begin{pmatrix} -.75 & .25 & .25 & .25 & .25 & .25 & .25 & .25 \\ .25 & -.75 & .25 & .25 & .25 & .25 & .25 & .25 \\ .25 & .25 & -.75 & .25 & .25 & .25 & .25 & .25 \\ .25 & .25 & .25 & -.75 & .25 & .25 & .25 & .25 \\ .25 & .25 & .25 & .25 & -.75 & .25 & .25 & .25 \\ .25 & .25 & .25 & .25 & .25 & -.75 & .25 & .25 \\ .25 & .25 & .25 & .25 & .25 & .25 & -.75 & .25 \\ .25 & .25 & .25 & .25 & .25 & .25 & .25 & -.75 \end{pmatrix}$$

  
Prof. D. K. Ghosh, Department of Physics, IIT Roorkee

Now let us tick it then take the example of energy code and we get how the matrices look like they structure on the matrix if you remember my d was.

(Refer Slide Time: 19:33)

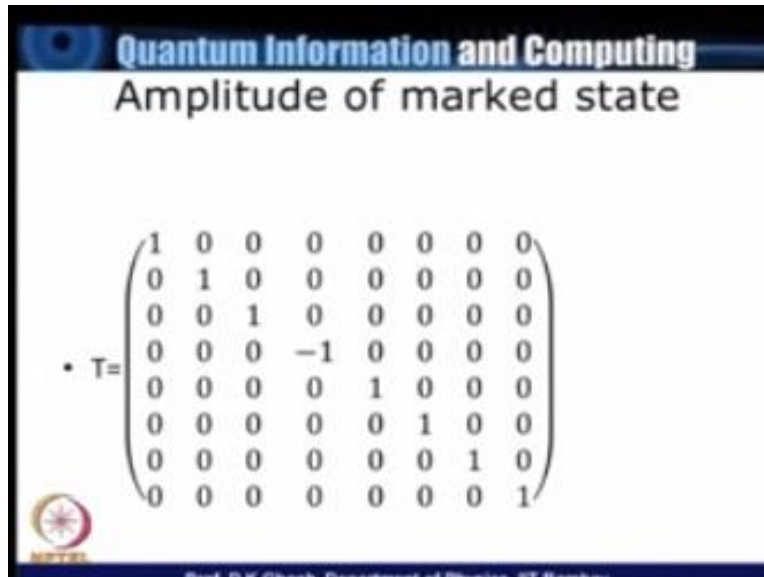

The image shows a handwritten derivation of a matrix  $D$  for  $N=8$ . At the top, the formula is given as  $D = -I + \frac{2j}{N}$  with  $N=8$  written to the right. Below this, the matrix  $D$  is written as an 8x8 matrix. The diagonal elements are  $-0.75$ ,  $-0.75$ , and  $-0.75$  (with an ellipsis between the second and third). The off-diagonal elements are  $0.25$ ,  $0.25$ , and  $0.25$  (with an ellipsis between the second and third). The matrix is enclosed in large parentheses. A hand is visible on the left side of the page, pointing towards the matrix.

$-i + 2j/N$  I am taking  $N = 8$  so this is going to then  $8/8$  and  $j$  is very simple because  $j$  is value is one also so if I applied that and getting the whole matrix on a slide that suppose I am write down attempt to write down part of it so  $-I$  has  $-1$  has each on the diagonal to that I must have  $2/8$  which is  $1/4$  and this identity make it is as  $0$  everywhere so therefore this matrix has  $-0.75 - 0.75$  etc. along the diagonal the full matrix is given in this the of the parallel elements because this has a half diagonal element  $0$  so this is  $+0.25, 0.25$  etc right up to the eighth element  $0.25$ .

So notice it is a fairly straight forward matrix and enumerating it if you are writing a classical computer program is standard quantum. So this is the way the matrix the look like. Now let us then look at the other matrix  $T$ .

(Refer Slide Time: 21:31)

Quantum Information and Computing  
Amplitude of marked state

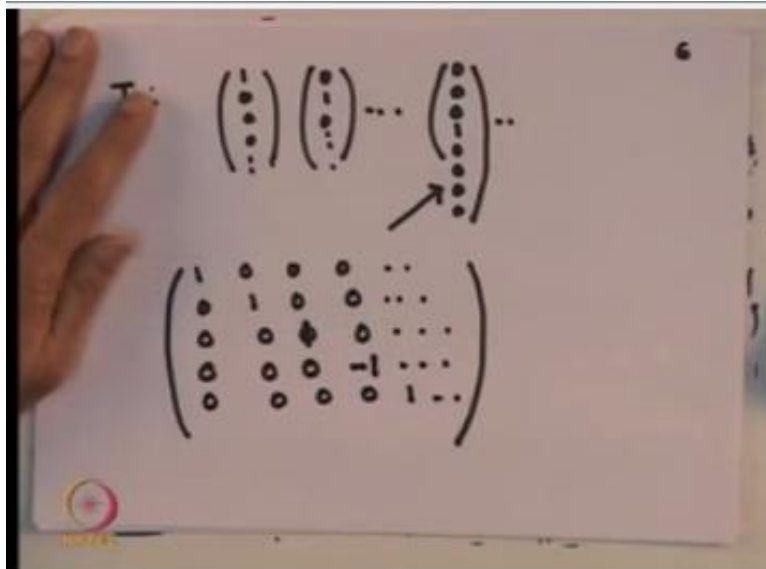

$$\bullet T = \begin{pmatrix} 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & -1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 \end{pmatrix}$$

Remember what T does this is the matrix which, what have done here is to take the matrix T also as an 8/8 matrix that what it does is to act on the bases states, now remember our bases states our bases states are 1 0 0 0 0 1 0 0 etc., so therefore if it act on a basis state T it should invert or flit the sin of the marked state which in this example I have taken to be the for the state. And the only way I can now remember that my computer short bases for the system is something like this 10000 etc eight of them.

And 0100 eight of them, but my fourth one is 0001 this is important not very much different but I am just pointing this out and the rest of them are there, but this T matrix acting on this state would convert this to -1, but acting of all other will keep the base is the same. So as a result my T matrix structure is it is the diagonal matrix which has elements 100 etc, 0100 the slides shows the full thing.

Then the fourth element here is this and rest of them again 000010 etc, the full matrix is shown here on the slide.

**Quantum Information and Computing**  
Amplitude of marked state

$$\cdot T = \begin{pmatrix} 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & -1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 \end{pmatrix}$$

 Prof. D.K. Ghosh, Department of Physics, IIT Bombay

So if such a matrix acts.

**Quantum Information and Computing**  
**Amplitude of marked state**

$$\cdot DT = \begin{pmatrix} .75 & .25 & .25 & -.25 & .25 & .25 & .25 & .25 \\ .25 & -.75 & .25 & -.25 & .25 & .25 & .25 & .25 \\ .25 & .25 & -.75 & -.25 & .25 & .25 & .25 & .25 \\ .25 & .25 & .25 & +.75 & .25 & .25 & .25 & .25 \\ .25 & .25 & .25 & -.25 & -.75 & .25 & .25 & .25 \\ .25 & .25 & .25 & -.25 & .25 & -.75 & .25 & .25 \\ .25 & .25 & .25 & -.25 & .25 & .25 & -.75 & .25 \\ .25 & .25 & .25 & -.25 & .25 & .25 & .25 & -.75 \end{pmatrix}$$

Prof. D. K. Ghosh, Department of Physics, IIT Bombay

So what is the amplitude of my marked state, what is this matrix DT. Now that is the way it acts, now if you look at DT matrix then the matrix is shown in the slide that look at what it will happen my D had -0.75, -0.75 all over. So therefore DT matrix will essentially remain the same - 0.75 I had +.25 +.25 etc, etc. But when you come to the fourth row, when you come to the fourth row what will happen is will find 0.25, 0.25, 0.25 then +0.75 and simply multiplied that because there is just one element to be interfere okay.

Actually this column will have the fourth column will have a total change this will become -0.25, --.25, look at the full matrix shown in this. This is simply multiplying one matrix with the other look at the slide.

(Refer Slide Time: 24:51)

$$DT = \begin{pmatrix} -.75 & .25 & .25 & -.25 \\ \vdots & & & \\ .25 & .25 & .25 & +.75 \end{pmatrix} \quad . 7 -$$

Which will give you the full matrix.

(Refer Slide Time: 24:53)

**Quantum Information and Computing**

**Amplitude of marked state**

•  $\begin{pmatrix} .75 & .25 & .25 & -.25 & .25 & .25 & .25 & .25 \\ .25 & -.75 & .25 & -.25 & .25 & .25 & .25 & .25 \\ .25 & .25 & -.75 & -.25 & .25 & .25 & .25 & .25 \\ .25 & .25 & .25 & +.75 & .25 & .25 & .25 & .25 \\ .25 & .25 & .25 & -.25 & -.75 & .25 & .25 & .25 \\ .25 & .25 & .25 & -.25 & .25 & -.75 & .25 & .25 \\ .25 & .25 & .25 & -.25 & .25 & .25 & -.75 & .25 \\ .25 & .25 & .25 & -.25 & .25 & .25 & .25 & -.75 \end{pmatrix}$

Prof. D. K. Ghosh, Department of Physics, IIT Bombay

Then you note this here that my, what is happened is this column has changed, in this column the every element has been end of a  $-0.25$  with respective D. So therefore, what happens.

(Refer Slide Time: 25:09)

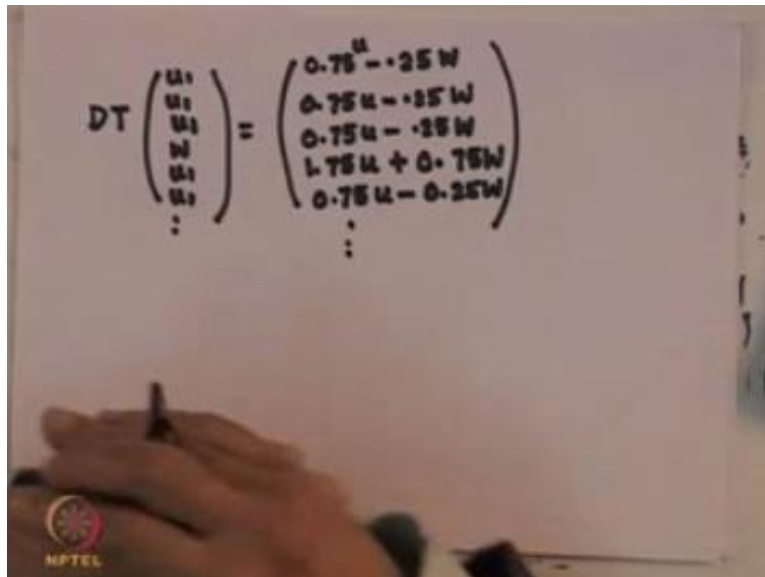

**Quantum Information and Computing**  
**Amplitude of marked state**

$$\bullet DT \begin{pmatrix} u \\ u \\ u \\ w \\ u \\ u \\ u \\ u \\ u \end{pmatrix} = \begin{pmatrix} .75u - .25w \\ .75u - .25w \\ .75u - .25w \\ 1.75u + 0.75w \\ .75u - .25w \\ .75u - .25w \\ .75u - .25w \\ .75u - .25w \\ .75u - .25w \end{pmatrix}$$

  
Prof. D.V. Ghosh, Department of Physics, IIT Bombay

If my DT is applied on the matrix a column vector which all elements are U other than the marked element of this. Now it is straightforward I have given you the matrix DT add it up, multiply it with that matrix and what you get here is a matrix which is given by this. This matrix I will just try to complete this work here.

(Refer Slide Time: 25:39)

A photograph of a whiteboard with a handwritten matrix equation. The equation is  $DT \begin{pmatrix} u_1 \\ u_1 \\ u_1 \\ w \\ u_1 \\ u_1 \\ \vdots \end{pmatrix} = \begin{pmatrix} 0.75u - 0.25W \\ 0.75u - 0.25W \\ 0.75u - 0.25W \\ 1.75u + 0.75W \\ 0.75u - 0.25W \\ \vdots \end{pmatrix}$ . A hand holding a pen is visible at the bottom left of the whiteboard. An NPTEL logo is in the bottom left corner of the image.

So I have got  $u_1, u_1$  all of them are the same let me write that down  $w$  and then  $u_1, u_1$  etc, that is equal to if you multiply you get this  $0.75 - 0.25, 0.75 u - 0.25W$  this is what you will get for all of them  $-0.25W$ .

But this element forth one which is different will give you a total different situation and again I have got  $0.75 u, -0.25W$  etc, etc. Once again this is a matrix equation though I have written eight of them but there are only a pair which is different and this pair is simply given by this equation this on the slide.

**Quantum Information and Computing**

### Amplitude of marked state

- The equations are equivalent to
$$u_1 = 0.75 u_0 - 0.25 w_0$$
$$w_1 = 1.75 u_0 + 0.75 w_0$$
- It may be checked that  $7u_1^2 + w_1^2 = 7u_0^2 + w_0^2$
- K- iterations may be done through
- $$\begin{pmatrix} u_n \\ w_n \end{pmatrix} = \begin{pmatrix} 0.75 & -0.25 \\ 1.75 & 0.75 \end{pmatrix}^k \begin{pmatrix} u_0 \\ w_0 \end{pmatrix}$$

Prof. P. K. Dutta, Department of Physics, IIT Bombay

So look at that, that is why you want each one of those gives me this and this is my  $w_1$  we could check that total norm is preserved I will doing unitary operation for several times  $u_1^2$ , because I have seven of the unmark state and  $w_1^2$  is  $7u_0^2 + w_0^2$  and I can perform k number of iterations by simple taking power k at power of this matrix starting from in initial state.

So what we have done so far is to tell you about Grover rotations, Grovers algorithm for finding out a particularly marked state in a nonstop change database we had given it is geometrical interpretation, we had also given some simple way of understanding it and then we have seen how this can be implemented by having unitary matrices.

And in this case the diffusion and the operator which inwards the initial state. This leads to selective amplification of a marked state and this allows us to identify the marked state. I will not be proving it, but we will leave it to you as an exercise to show that if in my database I had more than one marked state but for all of them a  $f(x) = 1$ . Supposing I have half a dozen of marked state having the same character state in a very big database then the same principle can be used to identify that.
