Implementing QFT

In the previous lecture we had seen how quantum Fourier transform can be used to find out the period of the function actually what we did was to show that if you assume a given period then own there would be only certain states which will would be appearing in your first register in particular what we found is for the case of three qubits if you assume a function with a period of 2 the measurement of the first register will either give you a state 0 or give you a state 4.

They similarly if you had assumed a different period then the one can easily work out what would have been the content of the first register it is not a unique but on the other hand depending upon your value the periodicity of the function you can find out what are the possible results of measurement of the first register.

(Refer Slide Time: 01:30)

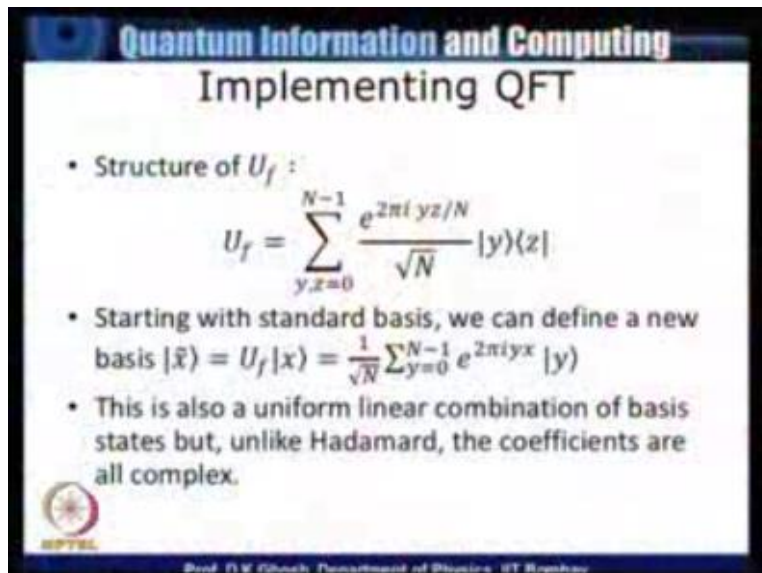

Quantum Information and Computing
Period Finding and QFT

- If the measurement of first register gives $|0\rangle$ or $|4\rangle$, the periodicity is 2
- Periodicity determines the non-vanishing states in the first register.

Prof. D.K. Ghosh, Department of Physics, IIT Bombay

So therefore if in this example that we give you if the first register gives you a 0 or 4 one can conclude that the periodicity of the function is 2, so periodicity determines the non vanishing states in the first register now this is an important information.

(Refer Slide Time: 01:51)

Quantum Information and Computing
Implementing QFT

- Structure of U_f :
$$U_f = \sum_{y,z=0}^{N-1} \frac{e^{2\pi i yz/N}}{\sqrt{N}} |y\rangle\langle z|$$
- Starting with standard basis, we can define a new basis $|\tilde{x}\rangle = U_f|x\rangle = \frac{1}{\sqrt{N}} \sum_{y=0}^{N-1} e^{2\pi i yx} |y\rangle$
- This is also a uniform linear combination of basis states but, unlike Hadamard, the coefficients are all complex.

Prof. D. V. Ghosh, Department of Physics, IIT Bombay

That will be utilizing later on the next question that we want to ask so we have seen that if we can take a Fourier transform this what will happen for a periodic function the natural question is there a unitary transformation which actually will do this job. So let me sort of explain what do I mean by this.

(Refer Slide Time: 02: 18)

Handwritten mathematical derivation on a whiteboard:

$$|\psi\rangle = \sum_x a_x |x\rangle.$$

$$|\psi'\rangle = U|\psi\rangle = \sum_x a_x U|x\rangle$$

$$= \sum_y \tilde{a}_y |y\rangle.$$

$$\tilde{a}_y = \frac{1}{\sqrt{N}} \sum_x \omega^{xy} a_x \quad \omega = e^{2\pi i/N}.$$

$$U = \sum_{y,z} \frac{e^{2\pi i yz/N}}{\sqrt{N}} |y\rangle\langle z|$$

So I had an arbitrary state ψ in the computational basis $\sum_x a_x |x\rangle$ and we said that my ψ' is operator U acting on ψ which gives me by linearity $\sum_x a_x U|x\rangle$ and that is equal to $\sum_y \tilde{a}_y |y\rangle$ where you are \tilde{a}_y is $1/\sqrt{N} \sum_x \omega^{xy} a_x$ where ω^N root of unity and as a result my U has a structure which is $\sum_{y,z} e^{2\pi i yz/N} / \sqrt{N}$ and here $y \times z$ you can see that this U acting on this here will because z must be than equal to x so therefore you will get the right factor that you want there so this is the type of operator that we are looking for.

(Refer Slide Time: 03:56)

Quantum Information and Computing
Implementing QFT

- Structure of U_f :
$$U_f = \sum_{y,z=0}^{N-1} \frac{e^{2\pi i yz/N}}{\sqrt{N}} |y\rangle\langle z|$$
- Starting with standard basis, we can define a new basis $|\tilde{x}\rangle = U_f|x\rangle = \frac{1}{\sqrt{N}} \sum_{y=0}^{N-1} e^{2\pi i yx} |y\rangle$
- This is also a uniform linear combination of basis states but, unlike Hadamard, the coefficients are all complex.

 IIT Bombay
Prof. D. V. Gishik, Department of Physics, IIT Bombay

So once I have got a structure of X which is here.

(Refer Slide Time: 04:02)

$$\begin{aligned} |\psi\rangle &= \sum_x a_x |x\rangle. \\ |\psi'\rangle &= U|\psi\rangle = \sum_x a_x U|x\rangle \\ &= \sum_y \alpha_y |y\rangle. \\ \alpha_y &= \frac{1}{\sqrt{N}} \sum_x \omega^{xy} a_x \quad \omega = e^{2\pi i/N}. \\ U &= \sum_{xy} \frac{e^{2\pi i xy/N}}{\sqrt{N}} \end{aligned}$$

Now notice one thing it tells me that if I started with a standard basis so what happens if I let U.

(Refer Slide Time: 04:14)

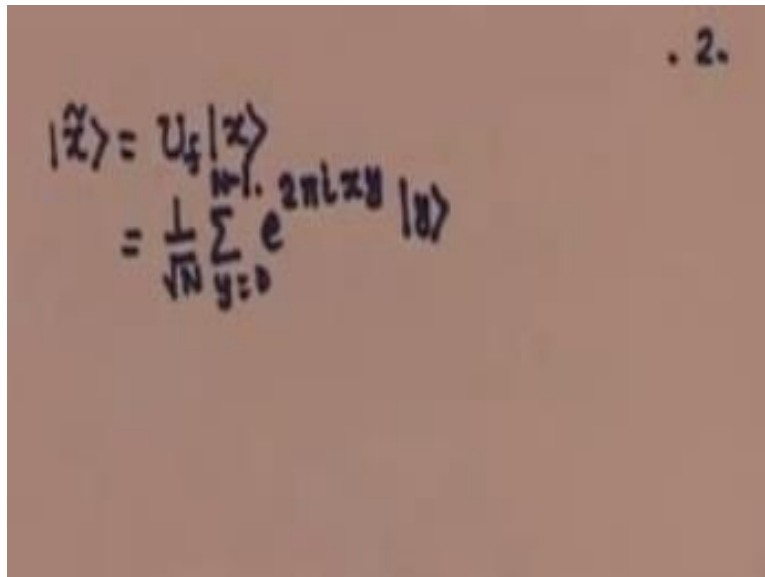

Quantum Information and Computing
Implementing QFT

- Structure of U_f :
$$U_f = \sum_{y,x=0}^{N-1} \frac{e^{2\pi i yz/N}}{\sqrt{N}} |y\rangle\langle z|$$
- Starting with standard basis, we can define a new basis $|\tilde{x}\rangle = U_f|x\rangle = \frac{1}{\sqrt{N}} \sum_{y=0}^{N-1} e^{2\pi i yx} |y\rangle$
- This is also a uniform linear combination of basis states but, unlike Hadamard, the coefficients are all complex.

 IITBOM
Prof. D. V. Giduch, Department of Physics, IIT Bombay

Act on my standard basis so I will get.

(Refer Slide Time: 04:18)

$$\begin{aligned} |\tilde{x}\rangle &= U_f |x\rangle \\ &= \frac{1}{\sqrt{N}} \sum_{y=0}^{N-1} e^{2\pi i x y} |y\rangle \end{aligned}$$

. 2.

\tilde{x} which is my new basis is U_f acting on let us say one of the basis states is x so this will be equal to $1/\sqrt{N} \sum_{y=0}^{N-1} e^{2\pi i x y}$ now this is also a linear combination of the basis states but unlike the Hadamard transform this is not the coefficients here are not equivalent and they are not unity and in fact they are complex but these are all uni-modular because $e^{2\pi i x y}$ as has a uni-modular the value of modulus is equal to 1.

(Refer Slide Time: 05:18)

Quantum Information and Computing
Implementing QFT

- $n=1, N=2$ (single qubit case)

$$\begin{aligned} |\bar{x}\rangle &= \frac{1}{\sqrt{2}} \sum_{y=0}^1 e^{2\pi i xy/2} |y\rangle \\ &= \frac{1}{\sqrt{2}} [|0\rangle + e^{2\pi i x/2} |1\rangle] \\ &= \frac{1}{\sqrt{2}} [|0\rangle + e^{2\pi i(0.x)} |1\rangle] \end{aligned}$$

A normal Hadamard Transform

NPTEL Prof. D.K. Ghosh, Department of Physics, IIT Bombay

Now let me look at how does one implement the QFT the simplest way of doing it would be to look at systematically what happens for the single qubit case for the two qubit case and then they generalization will be obvious so let me take a single qubit case.

(Refer Slide Time: 05:39)

The image shows a whiteboard with handwritten mathematical equations. At the top right, there is a small number '2'. The main equations are:

$$|\tilde{x}\rangle = U_{\frac{x}{2}}|x\rangle$$
$$= \frac{1}{\sqrt{N}} \sum_{y=0}^{N-1} e^{2\pi i xy/N} |y\rangle$$

Below this, the value of N is specified as N=2. The equation is then expanded for N=2:

$$|\tilde{x}\rangle = \frac{1}{\sqrt{2}} \sum_{y \in \{0,1\}} e^{2\pi i xy/2} |y\rangle$$
$$= \frac{1}{\sqrt{2}} [|0\rangle + e^{2\pi i x/2} |1\rangle]$$

N is equal to one corresponding to N is equal to two now what is the $x \sim$ so $x \sim$ is $1/\sqrt{2}$ Sum over Y is equal to 0 to 1 $e^{2\pi i xy/2} |y\rangle$ does n missing there. So since Y takes value 0 and 1 this is $1/\sqrt{2} |0\rangle$ the coefficient becomes equal to 1, $e^{2\pi i}$ now y is equal to 1, so I left with an X so I get $x/2|1\rangle$ Now I am going to write it in a slightly different notation and the notation is this, that if you recall.

(Refer Slide Time: 06:43)

. 2.

$$|\tilde{x}\rangle = U_x|x\rangle = \frac{1}{\sqrt{N}} \sum_{y=0}^{N-1} e^{2\pi i xy/N} |y\rangle$$

$$|\tilde{x}\rangle = \frac{1}{\sqrt{2}} \sum_{y=0,1} e^{2\pi i xy/2} |y\rangle$$

$$= \frac{1}{\sqrt{2}} [|0\rangle + e^{2\pi i x/2} |1\rangle]$$

$$= \frac{1}{\sqrt{2}} [|0\rangle + e^{2\pi i(0.x)} |1\rangle]$$

Hadamard.

Since my x, y etc in this case this way of writing takes value 0 and 1, the x/2 is binary expansion is simply 0.x, let me explain what I mean by this, see in a typical decimal number when you write for example 0.4 what do you mean? When you write 0.4 it means 4/10, if you write 0.03 it means 3/10² that is 3/100, in this case my basis is two, so therefore if I write something divided by 2 the binary point or binary decimal is a little bit of an oxymoron statement.

But binary points representation is 0.x, so I will write this as one 1/√2 [|0> + e^{2πi} times instead of writing x/2 I will write it with 0.x |1> Now what is this? Now notice this is nothing but a normal Hadamard transform, why? Because if this X happens to be zero so that I have got e⁰ = 1, I get 0+ 1/√2 on the other hand if this x happens to be equal to 1, now remember 0.1 in binary point representation is 1/2.

So that I get e^{2πi/2} which is e^{πi} which is equal -1, so I get 0-1/√2 which is as it odd to be in case of a Hadamard gate. Now this is of course trivial, so therefore in this particular case the QFT for n=2 is the implemented just by having a Hadamard gate, now that we have seen that for n = 1.

(Refer Slide Time: 09:01)

Quantum Information and Computing
Implementing QFTz

- $n=1, N=2$ (single qubit case)

$$\begin{aligned} |\bar{x}\rangle &= \frac{1}{\sqrt{2}} \sum_{y=0}^1 e^{2\pi i xy/2} |y\rangle \\ &= \frac{1}{\sqrt{2}} [|0\rangle + e^{2\pi i x/2} |1\rangle] \\ &= \frac{1}{\sqrt{2}} [|0\rangle + e^{2\pi i(0.x)} |1\rangle] \end{aligned}$$

- A normal Hadamard Transform

Prof. D.K. Ghosh, Department of Physics, IIT Bombay

That $N=2$ the Fourier transform may be implemented by application of a normal Hadamard transform, we will continue and let me take two qubit case $n=2$.

(Refer Slide Time: 09:16)

$$\begin{aligned}
 n=2 \quad N=4. \\
 |x\rangle &= \frac{1}{2} \sum_{y=0}^3 e^{2\pi i x y / 4} |y\rangle \\
 &= \frac{1}{2} \sum_{y_1, y_0} e^{2\pi i x (2y_1 + y_0) / 4} |y_1 y_0\rangle \quad \left. \begin{array}{l} y = 2y_1 + y_0 \\ y_1, y_0 \in \{0, 1\} \\ |y\rangle = |y_1 y_0\rangle \end{array} \right\} \\
 &= \left(\frac{1}{\sqrt{2}} \sum_{y_1 \in \{0, 1\}} e^{2\pi i x (2y_1) / 4} |y_1\rangle \right) \otimes \left(\sum_{y_0 \in \{0, 1\}} e^{2\pi i x y_0 / 4} |y_0\rangle \right) \\
 &= \frac{1}{\sqrt{2}} [|0\rangle + e^{2\pi i x / 2} |1\rangle] \otimes \frac{1}{\sqrt{2}} [|0\rangle + e^{2\pi i x / 4} |1\rangle]
 \end{aligned}$$

So that $N = 4$, now let me write down the Fourier transform so this is $1/\sqrt{n}$ square because there are two of them, $y = 0$ to 3 $e^{2\pi i x y / 4}$ and y of course. Now remember that in this way of writing x and y are two qubit situation, so therefore let me express expand this by writing $y = 2y_1 + y_0$. I will for the moment keep x the same, where y_1 as well as y_0 they take value 0 and 1 and my state y I will write as y_1, y_0 there is a direct product essentially.

So let me write this as equal to $1/2$ sum over y_1 and y_0 , keeping x the way it is $2y_1 + y_0$, y_4 and y_1, y_0 let me break up this term into product of two and distribute this $1/2$ into $1/\sqrt{2}$, so the first term I will write it as, some over y_1 $e^{2\pi i x (2y_1/4)}$ and $|y_1\rangle$ product with some over y_0 equal to 0 1 here also it is 01 $e^{2\pi i x}$ and you have $y_0/4$. And there is a $1/\sqrt{2}$ which is coming along with this, so let me since I do not have space there let me put it like this.

Now we are going to see what are these terms like, realizing that my y_1 takes value 0 and 1 , let me first split it up. So I have $1/\sqrt{2} |0\rangle$ because if $y_1 = 0$ this $e^0 = 1 + e^{2\pi i x} / 2$ because this is $2/4$ and $y_1 = 1$, so I have got 1 here and multiplied with $1/\sqrt{2}$ first term is $|0\rangle$ as before $+ e^{2\pi i x} y_0 = 1$ so it is $x/4 |1\rangle$, so this is, this is what I get as the Fourier transform of the 2 qubit situation. Let me now expand this x .

(Refer Slide Time: 12:55)

And realize that $x=2x_1+x_0$, now if that happens if you look at this term here.

(Refer Slide Time: 13:07)

$$\begin{aligned} n=2 \quad N=4. \quad 3 \\ |\tilde{x}\rangle &= \frac{1}{2} \sum_{y=0}^3 e^{2\pi i x y/4} |y\rangle \\ &= \frac{1}{2} \sum_{y_1, y_0} e^{2\pi i x (2y_1 + y_0)/4} |y_1 y_0\rangle \quad \left. \begin{array}{l} y = 2y_1 + y_0 \\ y_1, y_0 \in 0, 1 \\ |y\rangle = |y_1 y_0\rangle \end{array} \right\} \\ &= \left(\frac{1}{\sqrt{2}} \right) \sum_{y_1 \in 0, 1} e^{2\pi i x (2y_1/4)} |y_1\rangle \otimes \sum_{y_0 \in 0, 1} e^{2\pi i x y_0/4} \\ &= \frac{1}{\sqrt{2}} [|0\rangle + e^{2\pi i x/2} |1\rangle] \otimes \frac{1}{\sqrt{2}} [|0\rangle + e^{2\pi i x/4} |1\rangle] \end{aligned}$$

I have got $2\pi x/2$.

(Refer Slide Time: 13:12)

So $e^{2\pi i x/2}$ is $(2x_1+x_0)/2$ and that is equal to $e^{2\pi i}$ this $2/2$ so it is $x_1 x e^{2\pi i x_0/2}$ so notice one thing for both $x_1=0$ as well as 1 this term becomes equal to 1 , because $e^0=1$ and $e^{2\pi i}$ is also equal to 1 . So therefore this term that I had written down here can be rewritten as $1/\sqrt{2} [|0\rangle + e^{2\pi i x_0/2} |1\rangle]$ is coming from here because this is 1 times vector 1 multiplied with $1/\sqrt{2}$ again $[|0\rangle +$ but this time I have $2\pi i x/4$ so let me write it as $e^{2\pi i x}$ and x is $2x_1+x_0/4$ $|1\rangle$ I do not change the first term let it keep the way it was $e^{2\pi i x_0/2} |1\rangle$ multiplied by $1/\sqrt{2}$, let us look at this term, this is $|0\rangle +$.

Now look at this term here, it is $e^{2\pi i(2x_1)/4}$ which is nothing but $e^{\pi i x_1}$ so $e^{\pi i}$ being equal to -1 , so this term is $(-1)^{x_1}$ and the phase term is still there which is $e^{2\pi i x_0/4}$. Now we need to rewrite these in a particular way, I had already told you that this thing which is $x_0/2$ now since it is a single qubit $x_0/2$ can be written as $0.x_0$ in the binary point representation. And let us look at what do I get here, here I have got $e^{2\pi i x_0/4}$ and here there was a -1 to the power x_1 which I had actually written from here.

So let me bring back the phase notation so it is $2\pi i$ so 2 it so x_1 is what I had, so this is equal to e^0 . see here I have an x_1 and I have here an $x_0/4$, so this is $0.x_1 x_0$ sorry here that should have been a 2 , because this is $2x_1/4$, $x_1/2$ is $0.x_1$, $x_0/4$ is $0.x_0$, so finally if I collect them all together and

getting $0 + e^{2\pi i \cdot 0 \cdot x_0} \cdot 1$ over $\sqrt{2} \cdot 0 + e^{2\pi i \cdot 0 \cdot x_1} \cdot x_0$ the thing that I want to point out is the following that these terms actual this term is not particularly important because here i get - 1 to the power x_0 so which is nothing but an ordinary Hadamard transform but supposing I transform the first q bit Hadamard then this term.

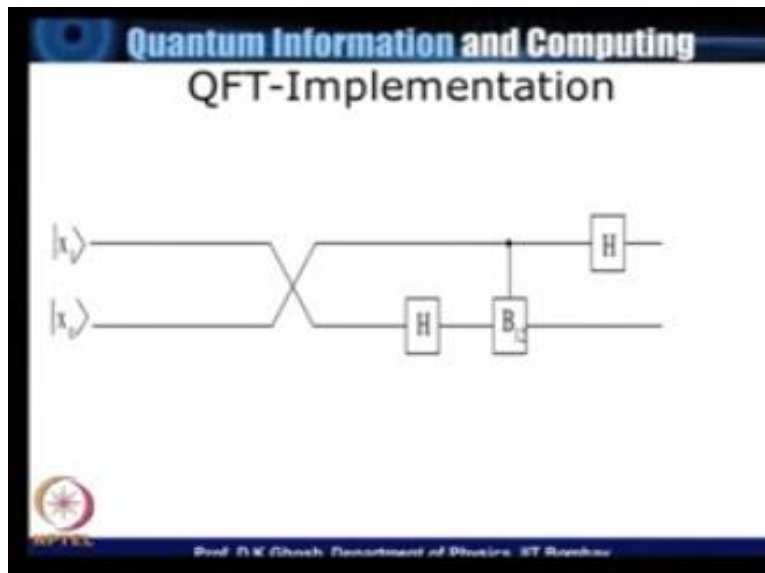

Where there is a phase rotation depending upon what the value of x_0 is then i will have a problem and because of that i need to change you notice here we have got $e^{2\pi i \cdot 0 \cdot x_1}$ which is nothing but $- 1^{x_1}$ this is what you expect from an ordinary Hadamard transform but the phase factor is $e^{2\pi i \cdot x_0 \cdot x_1}$ and that phase is there only when $x_0 = 1$ but if i had changed the value of x_0 here instead of keeping the old value then this would mess up things not, not the way I want it so what is the important is to remember that I want certain action to be taken in a particular way.

(Refer Slide Time: 19:07)

$$\begin{aligned}
 x &= 2x_1 + x_0 \\
 e^{2\pi i(2x_1+x_0)/2} &= e^{2\pi i x_1} \cdot e^{2\pi i x_0/2} \\
 \frac{1}{\sqrt{2}} [|0\rangle + e^{2\pi i x_0/2} |1\rangle] &\otimes \frac{1}{\sqrt{2}} [|0\rangle + e^{2\pi i x_1} |1\rangle] \\
 &= \frac{1}{\sqrt{2}} [|0\rangle + e^{2\pi i x_0/2} |1\rangle] \otimes \frac{1}{\sqrt{2}} [|0\rangle + (-1)^{x_1} e^{2\pi i x_0/2} |1\rangle] \\
 &\quad x_0/2 = 0 \cdot x_0 \\
 &\quad e^{2\pi i x_1/2} e^{2\pi i x_0/2} = e^{0 \cdot x_1 x_0} \\
 \frac{1}{\sqrt{2}} [|0\rangle + e^{2\pi i (0 \cdot x_0)} |1\rangle] &\otimes \frac{1}{\sqrt{2}} [|0\rangle + e^{2\pi i (0 \cdot x_0)} |1\rangle]
 \end{aligned}$$

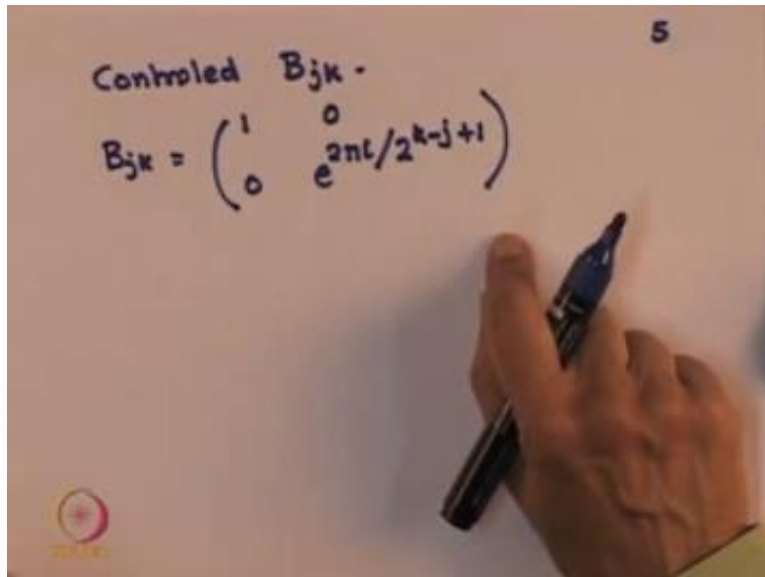

And since I need the x_0 to provide a control I cannot apply the gate on x_0 before I have done this and that is the reason why we will see in the slide.

(Refer Slide Time: 19:24)

That our circuit requires a reversal of x_0 and x_1 before the various gates are given now how does one implement such a the way to implement this is this we define what is known as a controlled B_{jk} can get.

(Refer Slide Time: 19:53)

A hand is writing the equation for a controlled B_{jk} gate on a whiteboard. The equation is $B_{jk} = \begin{pmatrix} 1 & 0 \\ 0 & e^{2\pi i / 2^{k-j+1}} \end{pmatrix}$. The word "Controlled" is written above the matrix. A small number "5" is in the top right corner of the whiteboard. A logo is visible in the bottom left corner.

Define the matrix B_{jk} by the following $e^{2\pi i / 2^{k-j+1}}$ the real k_j etc. Occur here we will see when we extend our logic for $n = 1$ and $n = 2$ to the general case but, but this is what a controlled B_{jk} gate does so let us look at.

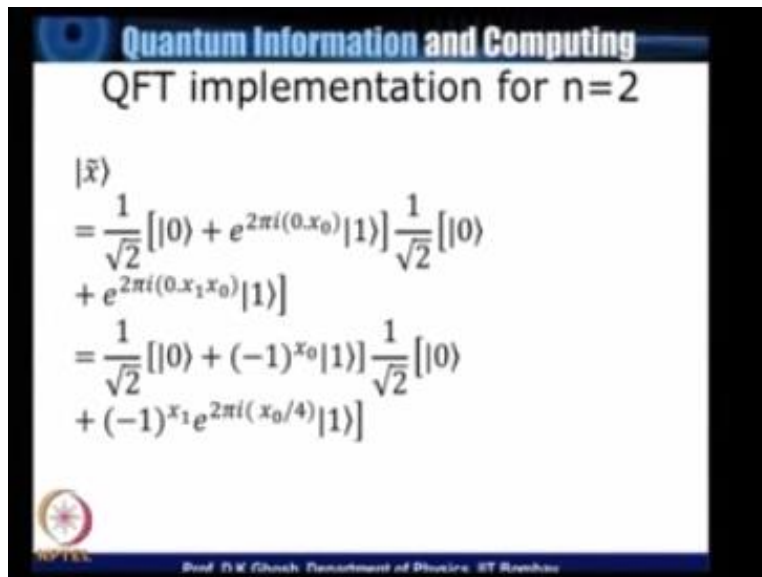

(Refer Slide Time: 20:38)

Controlled B_{jk} - 5

$$B_{jk} = \begin{pmatrix} 1 & 0 \\ 0 & e^{2\pi i / 2^{k-j+1}} \end{pmatrix}$$
$$B_{jk} |x, y\rangle = \left(e^{\frac{2\pi i}{2^{k-j+1}} xy} \right) |x, y\rangle$$
$$= |x, y\rangle \quad \text{if } x = 0$$
$$= \exp\left(\frac{2\pi i}{2^{k-j+1}}\right) |y\rangle$$

What is the effect of controlled B_{jk} on let us say state xy the controlled B_{jk} gate acting on this gives me e^i okay let me write it $2\pi i / 2^{k-j+1} xy$ that is a phase factor xy now what does it give me it tells me if $x = 0$ this is nothing but xy on the other hand if $x = 1$ it picks up a phase that is exponential of $2\pi i / 2^{k-j+1} y$ now with this let us return back to.

(Refer Slide Time: 21:51)

Quantum Information and Computing
QFT implementation for $n=2$

$$\begin{aligned} |\bar{x}\rangle &= \frac{1}{\sqrt{2}} [|0\rangle + e^{2\pi i(0.x_0)} |1\rangle] \frac{1}{\sqrt{2}} [|0\rangle \\ &+ e^{2\pi i(0.x_1x_0)} |1\rangle] \\ &= \frac{1}{\sqrt{2}} [|0\rangle + (-1)^{x_0} |1\rangle] \frac{1}{\sqrt{2}} [|0\rangle \\ &+ (-1)^{x_1} e^{2\pi i(x_0/4)} |1\rangle] \end{aligned}$$

 Prof. D.K. Ghosh, Department of Physics, IIT Roorkee

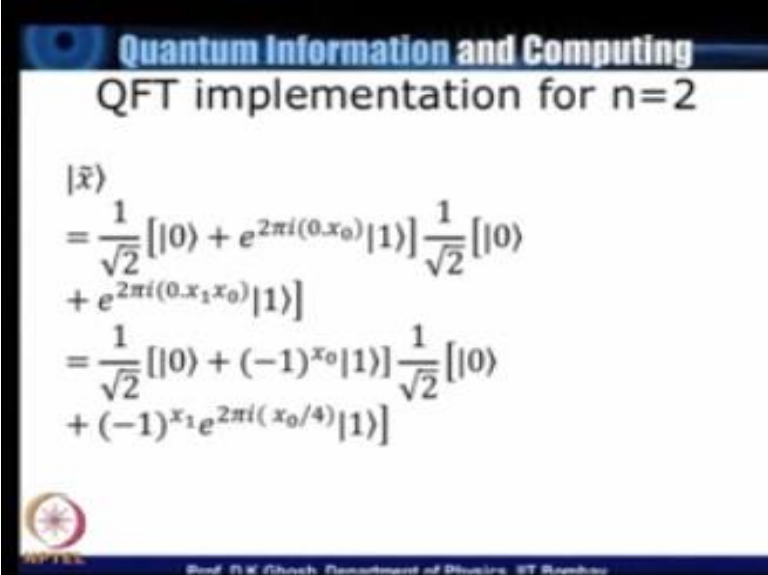

Our previous slide so we said my X_{\sim} which was the Fourier transform was given by the slide.

(Refer Slide Time: 22:02)

$$X = \frac{1}{2} [|0\rangle + (-1)^{x_0} |1\rangle]$$

So X then becomes equal to first one as we said is just Hadamard it $1/2 |0\rangle + -1^x |1\rangle$ nothing to be done there.

(Refer Slide Time: 22:16)

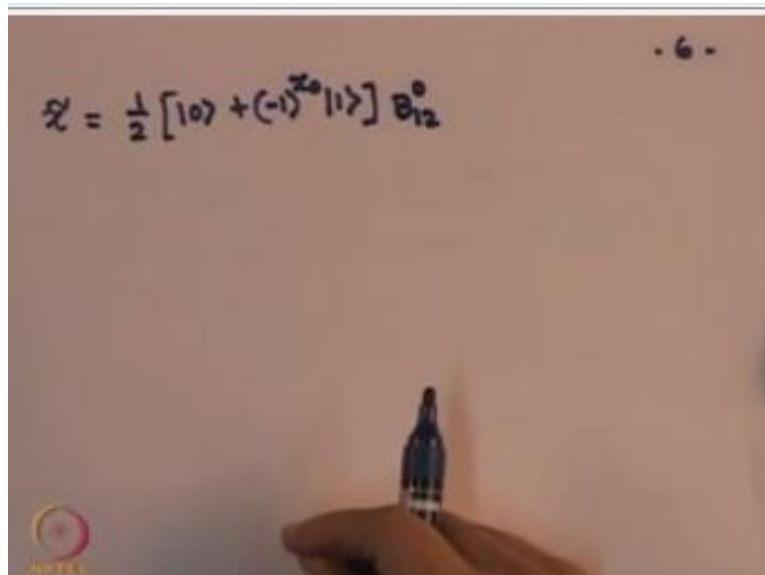

Quantum Information and Computing
QFT implementation for $n=2$

$$\begin{aligned} |\bar{x}\rangle &= \frac{1}{\sqrt{2}} [|0\rangle + e^{2\pi i(0.x_0)} |1\rangle] \frac{1}{\sqrt{2}} [|0\rangle \\ &+ e^{2\pi i(0.x_1x_0)} |1\rangle] \\ &= \frac{1}{\sqrt{2}} [|0\rangle + (-1)^{x_0} |1\rangle] \frac{1}{\sqrt{2}} [|0\rangle \\ &+ (-1)^{x_1} e^{2\pi i(x_0/4)} |1\rangle] \end{aligned}$$

Prof. D.K. Ghosh, Department of Physics, IIT Bombay

The second one if you refer to the slide again it was this term here $0 + e^{2\pi i 0.x_1 0}$ which we have seen can be written like this, but you see this is the control phase rotation.

(Refer Slide Time: 22:41)

$$X = \frac{1}{2} [|0\rangle + (-1)^{x_0} |1\rangle] B_{12}^0$$

- 6 -

So what we will say is this, this is equal to $B_{1,2,0}$, why 1,2 because I had defined.

(Refer Slide Time: 22:49)

Controlled B_{jk} - 5

$$B_{jk} = \begin{pmatrix} 1 & 0 \\ 0 & e^{2\pi i / 2^{k-j+1}} \end{pmatrix}$$
$$B_{jk} |x, y\rangle = \left(e^{\frac{2\pi i}{2^{k-j+1}} xy} \right) |x, y\rangle$$
$$= |x, y\rangle \quad \text{cf } x=0$$
$$= \exp\left(\frac{2\pi i}{2^{k-j+1}}\right) |y\rangle$$

BJK gate as given by this so if $J = 1$ $K = 2i$ get $2-1+1$, so it is 2 square there $e^{2\pi i/2}$ now this is precisely what we had there in the slide.

(Refer Slide Time: 23:09)

Quantum Information and Computing
QFT implementation for $n=2$

$$\begin{aligned} |\bar{x}\rangle &= \frac{1}{\sqrt{2}} [|0\rangle + e^{2\pi i(0.x_0)} |1\rangle] \frac{1}{\sqrt{2}} [|0\rangle \\ &+ e^{2\pi i(0.x_1x_0)} |1\rangle] \\ &= \frac{1}{\sqrt{2}} [|0\rangle + (-1)^{x_0} |1\rangle] \frac{1}{\sqrt{2}} [|0\rangle \\ &+ (-1)^{x_1} e^{2\pi i(x_0/4)} |1\rangle] \end{aligned}$$

 Prof. D.K. Ghosh, Department of Physics, IIT Bombay

So that this thing we should be able to write as $B_{1,2,0}$.

(Refer Slide Time: 23:17)

$$\begin{aligned}
 X &= \frac{1}{2} [|0\rangle + (-1)^{x_0} |1\rangle] B_{12}^0 [|0\rangle + (-1)^{x_1} |1\rangle] \\
 &= \frac{1}{2} [U_H |x_0\rangle] \otimes B_{12}^0 U_H |x_1\rangle \\
 &= \frac{1}{2} [(U_H \otimes I) B_{12}^0 (I \otimes U_H)] |x_0 x_1\rangle \\
 &= \frac{1}{2} [(U_H \otimes I) B_{12}^0 (I \otimes U_H)] \text{Swap } |x_1 x_0\rangle
 \end{aligned}$$

Acting on $0 + (-1)^{x_1}$ on 1, so these states are entangled because you notice the first one which refers to x_1 has a $(-1)^{x_0}$ but the second one has $(-1)^{x_1}$. So in other words the output is in reverse order. Now so what do I do the way to mend this situation is to do the following, X is $\frac{1}{2}$ the first term is $U_H X_0$ second one is $B_{12}^0 U_H$ acting on X_1 which is equal to half of $U_H \otimes I B_{12}^0 I \otimes U_H$ the different order because one of them acts from the X_0 the other one acts on Y , but it acts on $X_0 X_1$ this is what we want.

But you realize that what we had was a state which had $X_1 X_0$ so therefore I would write this as $\frac{1}{2} U_H \otimes I B_{12}^0$ also swap $X_1 X_0$. So what it means is this before applying these operations. We must swap the order in which X_1 and X_0 are appearing.

(Refer Slide Time: 25:30)

$$\begin{aligned} \mathcal{X} &= \frac{1}{2} \left[\underbrace{|0\rangle + (-1)^{x_0} |1\rangle}_{(-1)^{x_0}} \right] B_{12}^0 \left[\underbrace{|0\rangle + (-1)^{x_1} |1\rangle}_{(-1)^{x_1}} \right] \\ \mathcal{X} &= \frac{1}{2} [U_H |x_0\rangle] \otimes B_{12}^0 U_H |x_1\rangle \\ &= \frac{1}{2} [(U_H \otimes I) B_{12}^0 (I \otimes U_H)] |x_0 x_1\rangle \\ &= \frac{1}{2} [(U_H \otimes I) B_{12}^0 (I \otimes U_H)] \text{Swap } |x_1 x_0\rangle \end{aligned}$$

And then carry on this thing so that my final state comes up in the current order because what we noticed is my X_1 and X_0 were getting swapped.

Quantum Information and Computing
QFT- implementation for $n=2$

- First term is Hadamard transform
- Second term is a Hadamard transform followed by a rotation by $\frac{2\pi x_0}{4}$ (i.e. only if $x_0 = 1$, there is a rotation by $2\pi/4$)

Prof. P. K. Ghosh, Department of Physics, IIT Bombay

Now look at a picture so this is this is what we said here that there is a rotation selective rotation depending upon what is the value of X_0 in the second one.

(Refer Slide Time: 25:59)

And a simple circuit will tell you this that supposing you had X_1 and X_0 now you do not want these operations to just take place on X_1 and X_0 . So what I do is I swap this question we swap it and then as we have seen that on the first line which is not affected by this control I put a Hadamard gate there and then on the second line I put a Hadamard and be wondering. Now if I do that then the operations would have been done in the order that we want.

Because the way my states came they were reversed. So we have done couple of things in this and the previous lecture one was to point out that quantum Fourier transform can be used to infer the period of a function which is periodic with a discrete periodicity, and the second one we saw by specific examples of 1 and 2 qubit cases how to implement Fourier transforms in a quantum circuits and for that we had two additional things namely a controlled BJK gate and a swapping of the bits before we apply this transforms.

We will see later when we extend this idea to a general n qubit case the, what we have to do is to permute the bits first and then apply the operations the BJK gate the Hadamard gate etc.
