Bra-Ket Algebra and Linear Harmonic Oscillator - II
Lecture no # 03
The Linear Harmonic Oscillator using Bra and Ket Algebra (Contd..)

Previous lecture, we had introduced the Bra and Ket algebra, the concept of linear vector spaces and had solved the harmonic oscillator problem.

(Refer Slide Time: 00:46)

Handwritten notes on a whiteboard showing the derivation of energy levels for a harmonic oscillator using Bra-Ket notation.

$$H = \frac{p^2}{2\mu} + \frac{1}{2}\mu\omega^2 x^2$$

$$H|H'\rangle = \underline{H'}|H'\rangle$$

$$H'| = E_n = \left(n + \frac{1}{2}\right)\hbar\omega$$

$$n = 0, 1, 2, \dots$$

$$|P\rangle = a|n\rangle$$

$$H|P\rangle = \left(n + \frac{1}{2}\right)\hbar\omega|P\rangle$$

$$\begin{cases} \langle m|n\rangle = 0 & m \neq n \checkmark \\ \langle n|n\rangle = 1 & \text{NC} \end{cases}$$

$$\langle m|n\rangle = \delta_{mn} \begin{cases} = 0 & m \neq n \\ = 1 & m = n \end{cases}$$

Kronecker delta δ_{mn}

NPTEL logo

For the harmonic oscillator, the Hamiltonian was given by p^2 by 2μ plus half $\mu\omega^2 x^2$. Our objective was to solve the eigen value equation. This represents the eigen value equation and H' is the eigen value and $|H'\rangle$ represents the corresponding eigen ket.

We had shown that the eigen values H' is equal to the E_n . This is equal to n plus half $\hbar\omega$, where n takes the values 0, 1, 2, 3 etcetera. So, we obtained the same eigen values and we have obtained while solving the Schrodinger equation.

Corresponding, to the eigen ket H , eigen value H prime, the eigen ket is denoted by ket H prime. So, we denote this by H ket n is equal to n plus half \hbar cross ω ket n . This is the eigen value and corresponding to the eigen value n plus half \hbar cross ω , ket n are the eigen kets.

Now, since H is a Hermitian operator. All the eigen values are of course real. But, we had shown that eigen kets belonging to different eigen values, must be orthogonal. That is $\langle m | n \rangle$ must be equal to 0, if m is not equal to n . Furthermore, since this is a linear of equation, any multiple of ket n , let us suppose, I write ket p is equal to some multiple of ket n . Then, if I multiply both sides by the complex number C , then H ket p , p is also an eigen ket, belonging to same eigen value n plus half \hbar cross ω . So, the eigen kets are determined within the multiplicative constant and we choose the multiplicative constant such that they are normalized.

This is the orthogonality condition and this is the normalization condition. We can combine these two (Refer Slide Time: 03:46) and we obtain we can write $\langle m | n \rangle$ is equal to δ_{mn} , which is the Kronecker delta symbol, which is 0, if m is not equal to n , and is equal to 1, if m equal to n . This is known as the Kronecker delta function. So, these are the eigen values and eigen ket of the operator H .

(Refer Slide Time: 04:29)

$$\begin{aligned}
 H|n\rangle &= \underbrace{\left(n + \frac{1}{2}\right)\hbar\omega}_{H'}|n\rangle \\
 H\{a|n\rangle\} &= (H' - \hbar\omega)\{a|n\rangle\} \\
 &= \left(n - \frac{1}{2}\right)\hbar\omega\{a|n\rangle\} \quad a|n\rangle \neq 0 \\
 H|n-1\rangle &= \left(n - \frac{1}{2}\right)\hbar\omega|n-1\rangle \\
 |p\rangle = a|n\rangle &= c_n|n-1\rangle \quad \hbar\omega \bar{a}a = H - \frac{1}{2}\hbar\omega \\
 \langle p| &= \langle n|\bar{a} = c_n^* \langle n-1| \\
 \hbar\omega \langle p|p\rangle &= \langle n|\hbar\omega \bar{a}a|n\rangle = \hbar\omega |c_n|^2 \underbrace{\langle n-1|n-1\rangle}_1 \\
 &= \langle n|H - \frac{1}{2}\hbar\omega|n\rangle
 \end{aligned}$$

$a = \frac{\mu\omega x + ip}{\sqrt{2\mu\hbar\omega}}$

Now, I rewrite this equation, so I have H ket n is equal to n plus half \hbar cross ω ket n . We can also introduce two operators, which is a and a bar. So, a was equal to μ

$\omega \times \text{plus } i p$, under root of $2 \mu \hbar \times \omega$ and a bar was the adjoint of this. We had shown that $H \ket{n}$, so if this is H' , and then this will be the eigen value and is $H' - \hbar \times \omega$, \ket{n} .

If \ket{n} is the eigen ket of the operator H , and the corresponding eigen value is the H' , then \ket{n} is also an eigen ket of operator H , belonging to the eigen value $H' - \hbar \times \omega$, provided of course, as I have mentioned that \ket{n} is not a null ket, because this is a null ket then this is a trivial equation.

So therefore, if I subtract this, so this becomes $n - H' - \hbar \times \omega$, minus $n - \frac{1}{2} \hbar \times \omega$, \ket{n} . Now, we also know that if I replace n by $n - 1$, so if I replace n by $n - 1$, this becomes $n - \frac{1}{2} \hbar \times \omega$. So, this must be multiple of this.

I should have a ket n must be a multiple of a minus of ket $n - 1$. I write this as ket p and if I take \bra{p} , then this will be equal to n a bar is equal to $C \bra{n-1}$, and if I write $\hbar \times \omega \bra{p} \ket{p}$, then this will be equal to $n \hbar \times \omega$; this is just the number, so I can put it anywhere I feel like, a bar \ket{n} . On my right hand side, will be $\hbar \times \omega \bmod C n^2$, $\bra{n-1} \ket{n-1}$, but since they are normalized, so this is equal to 1.

Now, quite sometimes back, in my last lecture, I had shown that this was equal to $n \hbar \times \omega - \frac{1}{2} \hbar \times \omega$. I had shown that $\hbar \times \omega$ that $\hbar \times \omega$ a bar a , was equal to $H - \frac{1}{2} \hbar \times \omega$. Therefore, let me write down the right hands side. Sorry, is it coming here. (No volume between: 08:34-08:54)

(Refer Slide Time: 08:57)

Handwritten mathematical derivation on a slide:

$$\begin{aligned}
 &= (n + \frac{1}{2})\hbar\omega \langle n|n\rangle - \frac{1}{2}\hbar\omega \\
 &= n\hbar\omega \quad \text{where } \langle n|n\rangle = 1 \\
 &C_n = \sqrt{n} \\
 &a|n\rangle = \sqrt{n} |n-1\rangle \\
 &H\{\bar{a}|n\rangle\} = (n + \frac{1}{2} + 1)\hbar\omega \{\bar{a}|n\rangle\} \\
 &|Q\rangle = \bar{a}|n\rangle = d_n |n+1\rangle \quad \text{where } H' + \hbar\omega \\
 &\langle Q| = \langle n|a = d_n^* \langle n+1| \quad \text{where } \hbar\omega \bar{a}a = H + \frac{1}{2}\hbar\omega \\
 &\hbar\omega \langle Q|Q\rangle = \langle n| \underbrace{\hbar\omega a \bar{a}}_{H + \frac{1}{2}\hbar\omega} |n\rangle = |d_n|^2
 \end{aligned}$$

The right hand side is $\hbar\omega C_n^2$ and that is equal to $n\hbar\omega$; this is just a number, so I can take it out $C_n^2 = n$.

$|n\rangle$ is equal to \sqrt{n} times $|n-1\rangle$, so this is 1, and this is also 1, so this is \sqrt{n} times $|n-1\rangle$, so this quantity is equal to 1. I can, because the kets are normalized, so this will be equal to \sqrt{n} . So, this factor and this factor cancel out (Refer Slide Time: 10:10) and we obtain within phase factor C_n is equal to \sqrt{n} .

Therefore, we get the result that $|n\rangle$ is equal to \sqrt{n} times $|n-1\rangle$. This is a very important result that we must remember (Refer Slide Time: 10:37). Now, once if we start with the same equation and let me we start with the same equation, $H|n\rangle$ is equal to $(n + \frac{1}{2})\hbar\omega$, and instead of a , we write \bar{a} .

So, $\bar{a}|n\rangle$ is an eigen ket, corresponding to the eigen value $(n + \frac{3}{2})\hbar\omega$. Then the eigen value $(n + \frac{1}{2})\hbar\omega$, therefore, we obtain that H operating on $\bar{a}|n\rangle$, will be equal to $(n + \frac{3}{2})\hbar\omega$. So, this is $(n + \frac{1}{2})\hbar\omega + \hbar\omega$. So, it is $(n + \frac{3}{2})\hbar\omega$.

This will be $\bar{a}|n\rangle$, so $\bar{a}|n\rangle$ is an eigen ket of the operator H , belonging to the eigen value $(n + \frac{3}{2})\hbar\omega$. Therefore, $\bar{a}|n\rangle$, must be a multiple, let me write down say d_{n+1} of $|n+1\rangle$. So, let us suppose this is ket Q , then $\langle Q|$ will be

equal to n , which is $\langle n | H | n \rangle$. Just as we did last time, if we now multiply $\langle n | H | n \rangle$ by $\hbar \omega$, this is equal to $\langle n | H | n \rangle \hbar \omega$. This is equal to $\hbar \omega (n + \frac{1}{2})$ and that is 1.

Now, in lecture before this, we had said that $\langle n | H | n \rangle$ was equal to H plus half $\hbar \omega$. So, this quantity is H plus half $\hbar \omega$.

(Refer Slide Time: 14:08)

The image shows a whiteboard with handwritten mathematical derivations. The first part shows the calculation of $\langle n | d_n^2 | n \rangle$:

$$\begin{aligned} \langle n | d_n^2 | n \rangle &= \langle n | H | n \rangle + \frac{1}{2} \hbar \omega \langle n | n \rangle \\ &= (n + \frac{1}{2}) \hbar \omega \langle n | n \rangle + \frac{1}{2} \hbar \omega \\ &= (n + 1) \hbar \omega \end{aligned}$$

Then, the norm squared of d_n is given as:

$$d_n^2 = \sqrt{n+1}$$

Below this, the action of the lowering and raising operators on the $|n\rangle$ state is shown:

$$a |n\rangle = \sqrt{n} |n-1\rangle ; \quad \bar{a} |n\rangle = \sqrt{n+1} |n+1\rangle$$

It also notes that $a |0\rangle = 0$ and $|0\rangle \Rightarrow H' = \frac{1}{2} \hbar \omega$, with $c_1, c_2 = 0$.

At the bottom, there is a small diagram of a harmonic oscillator potential with a particle, and the text "NPTEL" is visible in the bottom left corner.

We rewrite this and we obtain $\langle n | d_n^2 | n \rangle$ and is equal to $n \hbar \omega$ plus half $\hbar \omega$. So, this is equal to n plus $\frac{1}{2}$, operating in, will be n plus half $\hbar \omega$, and then will be bra and ket n , which will be one. This is 1 plus half $\hbar \omega$.

I am sorry, (Refer Slide Time: 14:53) there is one thing that when I multiply this by $\hbar \omega$, I should have multiplied this also by $\hbar \omega$, because I wrote bra Q ket Q multiplied by $\hbar \omega$. So, I missed out writing the $\hbar \omega$ last time. This is your $\hbar \omega d_n^2$. So, this is 1 and this is half $\hbar \omega$. So, this becomes n plus 1 $\hbar \omega$. So, this $\hbar \omega$ here and this $\hbar \omega$ cancel out, and if I take the square root, so you will get d_n is equal to square root of n plus 1.

So, we get two very important relations. The first was a ket n is equal to square root of n minus 1, and the second one is a bra n is equal to square root of n plus 1, n plus 1.

Since, the operator a raises to by 1, number the value of n , and here it lowers the value of n . These are known as ladder operators or creation and destruction operator.

Now, in this case if we write a ket 0, then n is 0. So, this is a null ket, so this is the ground state and one cannot go below that. Ket 0 is the eigen ket; belonging to the eigen value H prime is equal to half \hbar cross ω . So, here once again, a is a non null operator, is even when I have two number say C_1, C_2 . If this is 0 then we can say either C_1 must be 0 or C_2 must be 0.

But in operator algebra, this argument is not valid. Here, a is non null operator, ket 0 is a non null ket, but a operating on ket 0, is a null ket, it is something like this. If you differentiate d^2 by dx square of $Ax + B$, this is a non null operator. This is a non null function, but if you differentiate this two, this is always 0. So, here you have this, a ket 0 is a null ket. It says that you cannot have an eigen value less than half \hbar cross ω . Now, with this algebra, we can very easily calculate many of the quantities.

(Refer Slide Time: 18:30)

Handwritten mathematical derivations for harmonic oscillator states:

- $\Delta x \Delta p$
- $\Delta x = \sqrt{\langle x^2 \rangle - \langle x \rangle^2}$
- $\langle x^2 \rangle = \int_{-\infty}^{+\infty} \psi_n^*(x) x^2 \psi_n(x) dx$
- $\langle x \rangle = \int_{-\infty}^{+\infty} \psi_n^*(x) x \psi_n(x) dx$
- $\langle p \rangle = \int_{-\infty}^{+\infty} \psi_n^*(x) \left(-i\hbar \frac{d}{dx} \psi_n(x) \right) dx$
- $\langle p^2 \rangle = \int_{-\infty}^{+\infty} \psi_n^*(x) \left[-\hbar^2 \frac{d^2}{dx^2} \psi_n(x) \right] dx$
- $H \psi_n(x) = E_n \psi_n(x)$
- $\psi_n = N_n H_n(\xi) e^{-\frac{1}{2}\xi^2}$
- $\int_{-\infty}^{+\infty} |\psi_n(x)|^2 dx = 1$
- $\langle x^2 \rangle = \langle n | x^2 | n \rangle$
- $\langle \theta \rangle = \langle n | \theta | n \rangle$

NPTEL logo is visible in the bottom left corner of the slide.

For example, let us suppose we want to calculate $\Delta x \Delta p$ for the harmonic oscillator states. Now, what do I mean by $\Delta x \Delta p$? Let me first just consider Δx , so Δx is the x square minus x average square under the root.

If you use Schrodinger type of wave functions, let us suppose we have $H \psi_n$ of x is equal to $E_n \psi_n$ of x , where ψ_n of x as you recall for the harmonic oscillation

problem was N of n , H of x to the power of minus half x square. These are again the normalized eigen functions. So, what will be my x square? I have to calculate like this. x square will be this, so let us suppose this is ψ_n of x , so this will be from minus infinity to plus infinity ψ_n^* of x , x square, ψ_n of x dx . These are normalized, so actually this is divided by $\int_{-\infty}^{\infty} \psi_n^* \psi_n dx$.

But we have assumed these are normalized wave functions, minus infinity to plus infinity $\int_{-\infty}^{\infty} \psi_n^* \psi_n dx$ is equal to 1. So, this is my x square. Similarly, x will be just the same quantity but, x square replaced by x , and as we had discussed, the p will be minus infinity to plus infinity ψ_n^* , I am removing, and then I must use the differential representation, so minus $i\hbar$ cross d/dx of ψ_n of x dx . Similarly, p square will be minus infinity to plus infinity, ψ_n^* of x , and p square will be, here minus and minus plus then minus, so this will be minus \hbar^2 cross d^2/dx^2 ψ_n by dx^2 . Now, using the Hermit gauss function, it is of course, possible to calculate these integrals but, it is in general they are very cumbersome.

What we will do now is to use operator algebra and calculate n x square n . This is my x square, so any operator the expectation value of any observable, will be at the n th state will be n , 0 , n . Let me illustrate this

(Refer Slide Time: 22:06)

The whiteboard contains the following handwritten derivations:

$$\langle x^2 \rangle = \langle n | x^2 | n \rangle$$

$$= \sqrt{\frac{\hbar}{2\mu\omega}} \left[\langle n | a | n \rangle + \langle n | \bar{a} | n \rangle \right]$$

$$a | n \rangle = \sqrt{n} | n-1 \rangle$$

$$\sqrt{n} \langle n | n-1 \rangle = 0$$

$$\bar{a} | n \rangle = \sqrt{n+1} | n+1 \rangle$$

$$\underbrace{\langle n | n+1 \rangle}_0$$

$$\langle x \rangle = 0$$

$$a = \frac{\mu\omega x + ip}{\sqrt{2\mu\hbar\omega}}$$

$$\bar{a} = \frac{\mu\omega x - ip}{\sqrt{2\mu\hbar\omega}}$$

$$a + \bar{a} = \frac{2\mu\omega}{\sqrt{2\mu\hbar\omega}} x$$

$$\bar{x} = x ; \bar{p} = p$$

$$x = \sqrt{\frac{\hbar}{2\mu\omega}} (a + \bar{a})$$

Let me calculate what is x average? x average will be the average value of x , will be n x n . Now, you may recall that the operator a was equal to $\mu\omega x$ plus $i p$ divided by

under root of $2 \mu \hbar \omega$, and then a bar was equal to $\mu \omega x$, x bar is equal to x and this is minus $i p$, because x and p are observable, so x bar is equal to x and p bar is equal to p .

So, divided by under root of $2 \mu \hbar \omega$, if I add them up, then I will get a plus a bar is equal to the p and p will cancel out, so $2 \mu \omega$, so this will be $2 \mu \omega$ divided by under root of $2 \mu \hbar \omega$ times x . Therefore, x will be equal to under root of \hbar cross by $2 \mu \omega$ a plus a bar. This is the operator, so we will have this. This is equal to under root of \hbar cross by $2 \mu \omega$, n of a , a plus a bar, so plus n a bar ket n .

Now, this is very easy to calculate, as we just calculated that a ket n was equal to square root of n , n minus 1. So, this quantity will be bra n , n minus 1, and this is square root of n . So, this is 0. So, similarly, a bar ket n , is equal to square root of n plus 1. So, this will be bra n ket n plus 1, and this is because they are orthonormal kets, so this is also 0. So, we get the result expectation value of x is 0, corresponding to a particular state, eigen state of the harmonic oscillator. Let me calculate x square. So, what is x square? It is x times x .

(Refer Slide Time: 25:27)

Handwritten mathematical derivation on a whiteboard:

$$x = \sqrt{\frac{\hbar}{2\mu\omega}} (a + \bar{a})$$

$$x^2 = x x = \frac{\hbar}{2\mu\omega} [a a + a \bar{a} + \bar{a} a + \bar{a} \bar{a}]$$

$$\langle n | x^2 | n \rangle = \frac{\hbar}{2\mu\omega} \langle n | (a + \bar{a})(a + \bar{a}) | n \rangle$$

$\langle n a a n \rangle$	$\langle n \bar{a} \bar{a} n \rangle$
$\sqrt{n} \langle n a n-1 \rangle$	$\sqrt{n+1} \langle n \bar{a} n+1 \rangle$
$\sqrt{n(n-1)} \underbrace{\langle n n-2 \rangle}_0$	$\sqrt{n+1} \cdot \sqrt{n+2} \underbrace{\langle n n+2 \rangle}_0$

$\langle n | a a | n \rangle = 0$ & $\langle n | \bar{a} \bar{a} | n \rangle = 0$

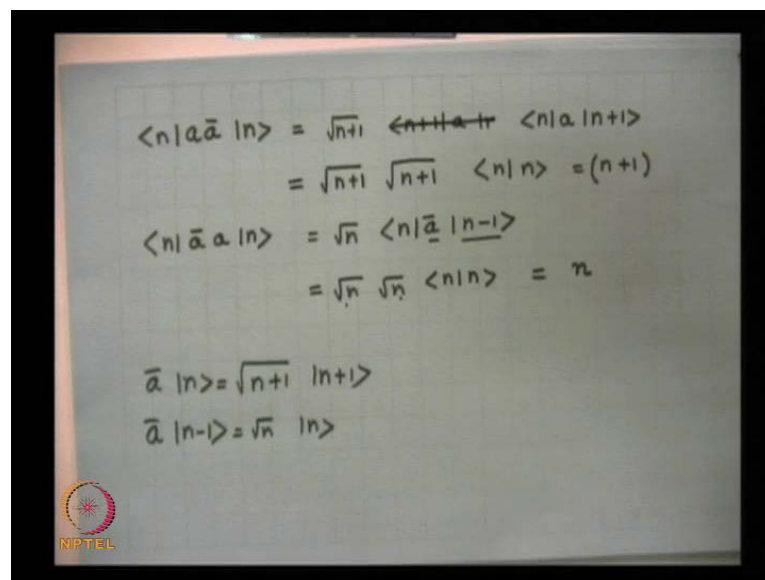

So, let me write down the expression for x . This is equal to \hbar cross by $2 \mu \omega$, a plus a bar, so x square, the square of an operator is just x times x . This will be equal to \hbar cross by $2 \mu \omega$, a plus a bar whole square. So, we must keep the order. So, this

will be a , a plus, a a bar plus, a bar a plus, a bar a bar. One must be very careful. One must not write $2 a$ a bar or a square plus a bar square plus $2 a$ a bar. No, because this a plus a bar has to be operated on a plus a bar. So, this will be a a plus, a a bar plus, a bar a plus a bar a bar.

Now, I want to evaluate $\text{bra } n \times \text{square ket } n$. Now, the first term will be $\text{bra } n$, you can do it. So, this will be a operating on that will be square root of n , $n a$ n minus 1, and this will be square root of n minus 1, so n into n minus 1, $n n$ minus 2. This will be 0, because these are eigen kets belonging to different eigen value, so the scalar product is 0. Similarly, a bar a bar, so you have $n a$ bar a bar ket n . This will be square root of n plus 1, $n a$ bar n plus 1, and this will be square root of n plus 1 times square root of n plus 2 n plus 2.

Since, these two numbers are not equal, so this will also be 0. Therefore, we get the relation that n, a, a, n is 0, and n, a bar, a bar is also 0. But, these matrix elements corresponding to this, the scalar product corresponding to this, will not be 0 as I will show you in a minute.

(Refer Slide Time: 28:21)

The image shows handwritten mathematical derivations for the matrix elements of the ladder operators a and a^\dagger in the number state basis. The derivations are as follows:

$$\begin{aligned}\langle n | a a^\dagger | n \rangle &= \sqrt{n+1} \langle n+1 | a^\dagger | n \rangle \\ &= \sqrt{n+1} \sqrt{n+1} \langle n | n \rangle = (n+1) \\ \langle n | a^\dagger a | n \rangle &= \sqrt{n} \langle n | a | n \rangle \\ &= \sqrt{n} \sqrt{n} \langle n | n \rangle = n\end{aligned}$$

Below these, the action of the operators on the states is given:

$$\begin{aligned}a^\dagger | n \rangle &= \sqrt{n+1} | n+1 \rangle \\ a | n \rangle &= \sqrt{n} | n-1 \rangle\end{aligned}$$

A small NIPTEL logo is visible in the bottom left corner of the slide.

We will have a, a bar ket n bra n , so this will be a bar ket n , will be equal to square root of n plus 1, is really very simple. I am sorry, so this is bra n, a, n plus 1. Now, this will be n plus 1, a , operating on n plus 1, is again n plus 1. So, this will be n , which is 1. So, this is equal to n plus 1.

Let me do the other one; n , a bar a ket n , so a ket n , will be square root of n , n minus 1 and a bar ket n minus 1 will be square root of n , n , n , because remember the square root of n equal to square root of n plus 1, n plus 1. So, if I replace n by n minus 1, so n minus 1 will be square root of n , n . This you must remember. So, this will be equal to square root of n , times square root of n , is just n . So, if I add this two, so this becomes equal to n plus n plus 1.

(Refer Slide Time: 30:34)

$$\begin{aligned} \langle n | x^2 | n \rangle &= \frac{\hbar}{2\mu\omega} \left[\langle n | a a | n \rangle + \langle n | a a | n \rangle_{n+1} + \langle n | \bar{a} a | n \rangle + \langle n | \bar{a} \bar{a} | n \rangle \right] \\ \langle x^2 \rangle &= \frac{\hbar}{\mu\omega} \left(n + \frac{1}{2} \right) \\ \langle x \rangle &= 0 \\ \Delta x &= \sqrt{\langle x^2 \rangle - \langle x \rangle^2} = \sqrt{\frac{\hbar}{\mu\omega}} \sqrt{n + \frac{1}{2}} \\ a &= \frac{\mu\omega x + i p}{\sqrt{2\mu\hbar\omega}} ; \bar{a} = \frac{\mu\omega x - i p}{\sqrt{2\mu\hbar\omega}} \\ i(a - \bar{a}) &= \frac{-1}{\sqrt{2\mu\hbar\omega}} 2ip \Rightarrow p = i\sqrt{\frac{\mu\hbar\omega}{2}} (a - \bar{a}) \end{aligned}$$

So, in this expression, let me therefore, we have this therefore, n x square n , will be equal to \hbar cross by $2\mu\omega$. So, this is 0 and so let me write it down; n , a , a , n , plus n , a bar, n plus n a bar, a , n plus n , a bar, a bar, n .

We have just now shown that this is 0 and this is 0. This is equal to a , a bar that equal to n plus 1, and this is equal to n . Therefore, this will be $2n$ plus 1, and if I take the half inside, so you will get \hbar cross by $\mu\omega$, n plus half. So, my expectation value of x square is this. x is 0, therefore, Δx is equal to x square minus x average square, but this is 0. So, you will have under root of \hbar cross $\mu\omega$ under root of n plus half.

One result we have obtained. Similarly, we have, we wrote down the two operators; a , which was equal to $\mu\omega x$ plus $i p$ divided by under root of $\mu 2 \hbar$ cross ω , and a bar is equal to $\mu\omega x$ minus $i p$ by under root of $2 \mu \hbar$ cross ω . Now, one can immediately see, in order to obtain an expression from x , we add them up. In order to obtain an expression from p , you must subtract them.

You get a minus a bar, will be, if I take out $2 \mu h$ cross ω outside, then this will be $i p$ minus of minus $i p$. Therefore, this will be $2 i p$. So, I multiply both sides by i , so you get p is equal to and there will be minus sign here, so it will be under root of μh cross ω by 2. Then i and then a bar minus a , and you see if I multiply this by i , so if I multiply this by i , this becomes a minus sign here, and this will be i and if I take the minus sign here then a bar minus a .

(Refer Slide Time: 34:38)

$$p = i \sqrt{\frac{\mu \hbar \omega}{2}} (\bar{a} - a)$$

$$\langle p \rangle = \langle n | p | n \rangle = i \sqrt{\frac{\mu \hbar \omega}{2}} [\langle n | \bar{a} | n \rangle - \langle n | a | n \rangle]$$

$$= 0 \quad (\bar{a} - a)(\bar{a} - a)$$

$$\langle p^2 \rangle = - \frac{\mu \hbar \omega}{2} [\langle n | \bar{a} \bar{a} | n \rangle - \langle n | \bar{a} a | n \rangle - \langle n | a \bar{a} | n \rangle + \langle n | a a | n \rangle]$$

$$\Delta p = \sqrt{\langle p^2 \rangle - \langle p \rangle^2}$$

$$\Delta p \Delta x = (n + \frac{1}{2}) \hbar \omega$$

Therefore, we finally, obtain that the operator, the representation of the operator p is equal to $i \mu h$ cross ω by 2 a bar minus a . Now, it is trivial, it is really, once we have done to calculate the expectation value of p and expectation value of p square. So, you have expectation value of p is equal to bra n , ket p , ket n . So, this will be i under root of h cross ω by 2 $n a$ bar n , minus n, a, n . As we have done, before this is proportional to ket n plus 1. So, this is 0, this is proportional to ket n minus 1, so this scalar product of that is 0, so this is 0.

And the second one is equally straight forward. So, p square will be equal to $n p$ square. So, if I square this, I will get minus μh cross ω by 2, and then there will be 4 terms, and this if I multiply, a bar minus a , with a bar minus a , so it will be a bar minus a multiplied by a bar minus a . So, once again, we have to be very careful and we have to write them in proper order. So, a bar a , a bar a bar ket n , then operating on this, will be

minus n a bar a ket n , and this term minus n , a, a bar ket n . this operating on **this will be...** (Refer Slide Time: 36:53).

I hope you know realize that this term will be n plus 1, some multiple, and then a bar n plus 1 will be proportional to n plus 2. So, we will have a term which is n , n plus 2, which is 0, so this term is 0, similarly, this term is 0, and I can take the minus sign outside. I leave it as an exercise for you to calculate and you obtain an expression, which will be something like this is.

So, we can calculate then Δp , which will be equal to p square minus p average square. But, this quantity is 0 and this quantity we have just evaluated. If you multiply these two out, Δp and Δx , you will get n plus half \hbar cross. The uncertainty product is the minimum for the ground state and as we go to higher and higher states, the uncertainty product increases. This is the result, which we have obtained in a fairly straight forward manner by using the operator algebra.

The operator algebra allows us to calculate the matrix element. This particular quantity is known as the matrix element of the operator p (Refer Slide Time: 38:28) and one can easily calculate the uncertainty product. Now, so this completes one and we had said in my in our last lecture.

(Refer Slide Time: 38:49)

The image shows a series of handwritten mathematical equations on a grid background, likely from a lecture slide. The equations are as follows:

$$a|0\rangle = 0$$

$$\frac{\mu\omega x + i\hbar \frac{d}{dx}}{\sqrt{2\mu\hbar\omega}} \psi_0(x) = 0$$

$$\mu\omega x \psi_0(x) + \hbar \frac{d\psi_0}{dx} = 0$$

$$\psi_0(x) = N_0 e^{-\frac{1}{2}\xi^2}$$

$$\xi = \gamma x$$

$$\gamma = \sqrt{\frac{\mu\omega}{\hbar}}$$

$$N_0 = \sqrt{\frac{\gamma}{\sqrt{\pi}}}$$

$$\langle 0|0\rangle = \int_{-\infty}^{+\infty} |\psi_0(x)|^2 dx = 1$$

In the bottom left corner, there is a small circular logo with the text "NPTEL" below it.

We have said that a ket 0 is a null ket, and therefore, corresponding Schrödinger wave function will be such that what is a operator $\omega x + i p$ by under root of $2 \mu \hbar$ cross ψ_0 of x is equal to 0. So, this term goes off. So, we have obtained $\mu \omega x$, ψ_0 of x , and p is, i times minus $i \hbar$ cross d by dx . So, i square is minus 1, minus, minus plus 1, so plus \hbar^2 $d^2 \psi_0$ by dx^2 . We integrated this equation and this is a very simple integration and we have obtained for ψ_0 of x , some normalization constant e to the power of minus half ξ square.

So, we write this as N_0 , where ξ is equal to γx and γ is equal to $\mu \omega$ by \hbar cross, defined to be equal to. N_0 will be γ by root pie, square root of that. If you integrate this, so it is normalization is with respect to x that is minus infinity to plus infinity ψ_0 mod x whole square dx is equal to 1. We write this in terms of the Bra-Ket algebra that ket 0 bra 0 ket 0, this is equal to this.

The relationship between the Schrodinger wave function and bra and ket algebra is thorough the scalar product. This is a scalar product. Now, I want to find higher order wave functions. So, we now use that we have ψ_0 of x , we know, I want to know the higher order wave functions.

(Refer Slide Time: 41:26)

$$\begin{aligned} \bar{a} |n\rangle &= \sqrt{n+1} |n+1\rangle \\ \psi_{n+1}(x) &= \frac{1}{\sqrt{n+1}} \bar{a} \psi_n(x) \quad \begin{matrix} -ix - i\hbar \\ \xi = \gamma x \\ \gamma = \sqrt{\frac{\mu\omega}{\hbar}} \end{matrix} \\ &= \frac{1}{\sqrt{n+1}} \frac{\mu\omega x - i p}{\sqrt{2\mu\hbar\omega}} \psi_n(x) \\ &= \frac{1}{\sqrt{2(n+1)}} \left[\frac{\sqrt{\frac{\mu\omega}{\hbar}} x}{\xi} - \sqrt{\frac{\hbar}{\mu\omega}} \frac{d}{dx} \right] \psi_n(x) \end{aligned}$$

We have a bar ket n is equal to n plus 1. Therefore, we have ψ_{n+1} multiplied by square root of n plus 1. So, ψ_{n+1} of x , will be equal to 1 over square root of n plus 1, a bar ψ_n of x . So, you will have a bar is 1 over under root of n plus 1, a bar is μ

$\omega x - i p$ divided by $\sqrt{2\mu\hbar\omega}$, operating on ψ_n of x . So, if I take 2 outside, so I will get $\sqrt{2n+1}$, and then it will be $\mu\omega$ by $\hbar\omega x$, and this is $-i$ of x into $-i$ times of $\hbar\omega$. So, this will be $-i^2$ and i^2 is -1 , so $\hbar\omega$ by $\mu\omega$ d of dx ψ_n of x .

We have x is equal to, we had written down the x is equal to γx , where γ is equal to $\sqrt{\mu/\omega\hbar}$. So, this quantity is x and this quantity is d/dx .

(Refer Slide Time: 44:00)

$$\psi_{n+1}(x) = \frac{1}{\sqrt{2(n+1)}} \left[\xi - \frac{d}{d\xi} \right] \psi_n(x)$$

$$\psi_0(x) = N_0 e^{-\frac{1}{2}\xi^2}$$

$$\psi_1(x) = \frac{N_0}{\sqrt{2}} \left[\xi e^{-\frac{1}{2}\xi^2} + \xi e^{-\frac{1}{2}\xi^2} \right]$$

$$= N_1 H_1(\xi) e^{-\frac{1}{2}\xi^2} \quad N_n = \sqrt{\frac{\gamma}{\sqrt{\pi} n! 2^n}}$$

$$H_1(\xi) = 2\xi$$

Therefore, we get the very important result that from the operator algebra that $x \psi_{n+1}$ of x is equal to $\sqrt{2n+1}$, x minus, d/dx ψ_n of x . So, if I know $x \psi_n$ of x , by simple differentiation I can find out $x \psi_{n+1}$. But, I do know ψ_0 of x , ψ_0 of x , we know which is equal to $N_0 e^{-\frac{1}{2}\xi^2}$. So, if I substitute it there, so then ψ_1 of x , will be N_0 and divided by N_0 . So, this is 2 into 1 , and the first term is x into $e^{-\frac{1}{2}\xi^2}$, and if I differentiate this, so this will be x^2 , $2x$ by 2 , so plus x , $e^{-\frac{1}{2}\xi^2}$.

So, H_1 of x , $e^{-\frac{1}{2}\xi^2}$, but the general formula for N of n is equal to γ under root of π , n factorial divided by 2 , so 2 to the power of n , under the root. So, H_1 of x , as you know is equal to 2 times x . Now, I know ψ_1 of x so I can find out x^2 of x , and they will be automatically normalized. They will be

automatically normalized and once I have ψ_2 of x , then I can differentiate it again and I obtain ψ_3 of x and so on.

(Refer Slide Time: 46:43)

Handwritten notes on a whiteboard:

$$\psi_n(\xi) = N_n H_n(\xi) e^{-\frac{1}{2}\xi^2}$$

$$\langle m | n \rangle = \int_{-\infty}^{+\infty} \psi_m^* \psi_n(x) dx = \delta_{mn}$$

$$a = \frac{\mu\omega x + ip}{\sqrt{2\mu\hbar\omega}}$$

I want to solve the eigenvalue equation

$$a|\alpha\rangle = \alpha|\alpha\rangle$$

↑
#

And the final result is as you all know that that ψ_n of x is equal to N of n , H_n of x , e to the power of minus half x square, and here the relationship with the ket's is through the scalar product m ket n , is equal to ψ_m star ψ_n dx , from minus infinity to plus infinity, and that as you all know is a Kronecker delta function.

So, we have now derived how to use the operator algebra to find out the eigen states, the eigen function, the Schrodinger eigen functions of the corresponding to the linear harmonic oscillator problem. We, finally, do an extremely important calculation and that is find out the eigen values of the operator a . This is the annihilation operator that is a is equal to $\mu\omega x$ plus $i p$, divided by under root of $2\mu\hbar\omega$.

I want to solve the eigen value equation, a ket α is equal to α ket α , where α here is a number. Now, I want to solve this equation.

(Refer Slide Time: 49:02)

$$H|n\rangle = (n + \frac{1}{2})\hbar\omega|n\rangle$$

$$|A\rangle = \sum_n c_n |n\rangle$$

$$\langle m|A\rangle = \sum_n c_n \underbrace{\langle m|n\rangle}_{\delta_{mn}} = c_m \quad c_n = \langle n|A\rangle$$

$$|A\rangle = \sum_n |n\rangle c_n$$

$$|A\rangle = \left\{ \sum_n |n\rangle \langle n| \right\} |A\rangle$$

$$\sum_n |n\rangle \langle n| = 1 \quad \text{Completeness Condition}$$

Now, as we had mentioned earlier that the eigen ket of the operator H , form a complete set of wave function that is n plus half \hbar cross ω ket n , and Dirac argues this in a very beautiful manner. He says that in any state of a dynamical system, if you make a measurement of an observable, then it collapses to the eigen state of the observable. Since, and therefore, any state of a dynamical system should be expressible, as a linear combination of the eigen states of the observable. Therefore, the eigen kets of the observable must form a complete set of functions.

So therefore, any arbitrarily ket, say ket A can be described as a linear condition like this. How do I find this C_n ? This C_n , I find as, if I multiply this equation by say bra n , so I get bra n ket A . This is equal to summation, this is n, m, n . The summation is over n . This is equal to delta m, n , so when I sum over n , for a given value of m , this comes out to be C_m . So, I have any arbitrary ket A , if I sum over n , then C of n is equal to so C_m is equal to m .

So I write this down as, this is just the number. So, I can write this as n times C_n . I can always write that, because this is a number, I can put it anywhere I like. But, C_m , from this equation is C_n is equal to n, A . So, I write this as summation n, n, A . Now, this is a linear operator. Since, this is valid for any arbitrary ket A , so this must be a unit operator.

So, we say that this is known as the completeness condition of orthonormal kets n summed over all values of n . This is a unit operator; this is known as the completeness condition. So, any state can be expanded in terms of the eigen kets of the Hamiltonian.

(Refer Slide Time: 52:37)

$$\begin{aligned}
 a|\alpha\rangle &= \alpha|\alpha\rangle \\
 |\alpha\rangle &= \sum_{n=0}^{\infty} c_n |n\rangle \\
 a|\alpha\rangle &= \sum_{n=0,1,2,\dots}^{\infty} c_n a|n\rangle = \alpha \sum_{n=0}^{\infty} c_n |n\rangle \\
 &= \sum_{n=1,2,\dots}^{\infty} c_n \sqrt{n} |n-1\rangle = \alpha \sum_{n=0}^{\infty} c_n |n\rangle \\
 &= c_1 \sqrt{1} |0\rangle + c_2 \sqrt{2} |1\rangle + c_3 \sqrt{3} |2\rangle + \dots \\
 &= \alpha [c_0 |0\rangle + c_1 |1\rangle + c_2 |2\rangle + \dots] \\
 c_1 &= \frac{\alpha}{1} c_0 ; \quad c_2 = \frac{\alpha}{\sqrt{2}} c_1
 \end{aligned}$$

So, we rewrite this, a ket alpha. I want to solve this eigen value equation. I write alpha as summation C_n ket n , so for n equal to 0 to infinity, like 0, 1, 2, 3 and so on.

Let me do this carefully, so a operating on this C_n , are just numbers. So, a operating on ket alpha, is just summation $C_n a|n\rangle$, so n equal to 0 to infinity, and this will be equal to alpha times C_n ket n . $a|0\rangle$ is a null ket, and $a|n\rangle$ is as we have obtained n equal to now is 1, 2, 3, because n equal to 0 that is 0, so C_n square root of n , n minus 1. This is equal to alpha, n equal to 0 to infinity C_n ket n .

Now, let us expand this. Let us write this out, so we get C_1 square root of 1 ket 0, plus C_2 square root of 2 ket 1, plus C_3 square root of 3 ket 2, and this will be alpha times C_0 ket 0, plus C_1 ket 1, plus C_2 ket 2. Therefore, C_1 will be alpha by root 1, because this is a set of orthonormal kets, so if I multiply by bra 0, only this term will remain and this term will remain.

So, C_1 will be equal to alpha by root 1 C_0 . C_2 , now if I multiply by bra one, so all the terms will disappear, except this term and this term. So, you will get C_2 , will be equal to alpha by root 2, C_1 . So, C_1 is equal to alpha by root 1.
