Lecture - 63
Reflection of waves at a boundary – II
Electromagnetic waves reflecting from a dielectric surface

(Refer Slide Time: 00:15)

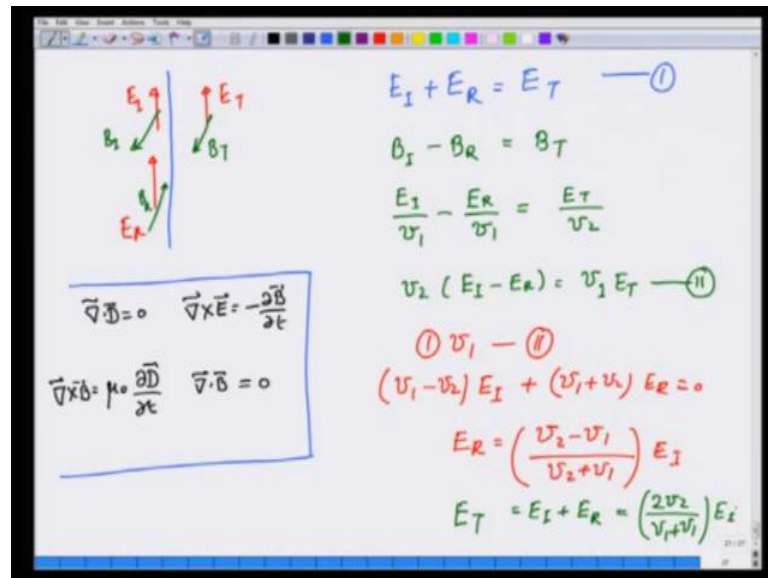

In the previous lecture we saw how when a mechanical wave, coming on a string goes from one medium to the other, the other media being another string, so that there is a boundary, there is a reflection. In a similar manner, we are now going to see that when electromagnetic waves fall from on a surface from one medium to the other, there is going to be reflection. We are going to assume right in the beginning there is a reflected wave, there is an incident wave, and there is a transmitted wave. Let us see one medium on one side has permittivity epsilon 1, on the other side has the permittivity epsilon 2, and let us take them to be nonmagnetic, so that there permeability is same mu 0, when the wave come from the left hand side.

Let us take its e field to be shown by red arrow, and because e cross b should give me the direction of propagation. I am going to show you the b filed by green colour is going to be pointing this way. So, this is the b field and e field is shown on that .On the other hand when it gets reflected. Suppose I take e to be in the same direction as the incoming wave.

Then $\mathbf{e} \times \mathbf{b}$ should give me the direction of propagation, and therefore, now the reflected wave is going to be the other way. So, this is \mathbf{b} reflected, let us call the first one be incident, this is \mathbf{e} incident and \mathbf{e} reflected. At the same time in the transmitted wave, there is going to be \mathbf{e} transmitted, and it is going in the same direction as the incident wave I am going to have \mathbf{b} incident, \mathbf{b} transmitted as shown here in the same direction as \mathbf{b} incident. So, we have set up what the electric field and magnetic fields are at the boundary, and now we need to apply the conditions. The boundary conditions are; e_{\parallel} is the same on both sides. This arises simply from Stokes theorem as follows. If I look at this boundary, and make a very small loop here, the \mathbf{e} field on this the side like this, on the side like this.

Then $\mathbf{e} \cdot d\mathbf{l}$ is going to be equal to integration curl of $\mathbf{e} \cdot d\mathbf{a}$. Curl of \mathbf{e} is nothing but $\nabla \times \mathbf{e} = -\dot{\mathbf{b}}$ it with a minus sign $\dot{\mathbf{b}} \cdot d\mathbf{a}$, and this is \mathbf{e} on the left hand side. Let me write left minus \mathbf{e}_r , because we are traversing the loop in two different directions; however, as we shrink the loop, we make the size, the red shaded region almost zero width. The right hand side becomes zero, and therefore, \mathbf{e} on the left should be equal to \mathbf{e} on the right side, so e_{\parallel} is same on both side. And this gives me the first equation, which is $\mathbf{e}_r + \mathbf{e}_t = \mathbf{e}_i + \mathbf{e}_r$ is equal to \mathbf{e}_t transmitted. This is equation number one. I referred back to the earlier equation that we had derived in the string which was $y_{\text{incident}} + y_{\text{reflected}} = y_{\text{transmitted}}$, this similar to that. In a similar manner b_{\parallel} on both sides, is equal, why is that, that again follows from Stokes theorem, because if I now take a loop like this parallel to \mathbf{b} . Then I have $\mathbf{b} \cdot d\mathbf{l}$ across this loop is equal to curl of $\mathbf{b} \cdot d\mathbf{a}$, which is equal to $\mu_0 \mathbf{j} \cdot d\mathbf{a}$. As the area $\rightarrow 0$, this $\mathbf{j} \cdot d\mathbf{a}$ goes to 0, and left hand side becomes zero, which again gives like the argument for electric field that b_{\parallel} on two sides must be equal.

(Refer Slide Time: 05:19)

So, on this boundary, I have e transmitted and e reflected. And I have b incident, b reflected, and b transmitted; the two equations are e incident plus e reflected e is equal to e transmitted; that is my equation one. And the other equation is, b incident b reflected in the other direction b reflected is equal to b transmitted; that is equation two. But now I know from electromagnetic theory that b incident is nothing but e incident divided by v_1 in that medium minus b reflected is nothing but e reflected over v_1 in that medium. This should be equal to e transmitted over v_2 in that medium. You may be little uncomfortable, because I did not do this equation for a wave in the medium, but the relationships are the same, and this can be obtained very easily by writing Maxwell's equations, the medium which are.

Let me just write the among the side for completeness, which are divergence of \vec{D} is equal to 0 and an absence of any charge, curl of \vec{E} remain the same as the minus $\frac{d\vec{B}}{dt}$. Curl of \vec{H} is equal to, again there is no free current the everything comes from displacement current is going to be $\mu_0 \frac{d\vec{D}}{dt}$ and divergence of \vec{B} is equal to 0. So, this again, if manipulate the relationship that b is equal to e by v . And this immediately needs to $v_2 e_i - v_1 e_r = v_1 e_t$; that is my equation two. I have got two equations, to unknowns; e transmitted and e reflected and I can solve for them. Let us multiply equation one by v_1 , and subtract equation two. This gives me $v_1 e_i - v_2 e_i + v_1 e_r = 0$, and this gives $e_r = \frac{v_2 - v_1}{v_2 + v_1} e_i$. Exactly similar

relationship in terms of velocity is in the two medium, as it was for string. As similarly e transmitted will be given by nothing but e incident plus e reflected which will give me $\frac{2v_2}{v_2 + v_1} e$ incident.

(Refer Slide Time: 08:44)

ϵ_1 | ϵ_2

$$\begin{cases} E_R = \frac{v_2 - v_1}{v_2 + v_1} E_I \\ E_T = \frac{2v_2}{v_2 + v_1} E_I \end{cases}$$

If $v_2 < v_1 \Rightarrow E_R$ opposite sign to E_I

$$v = \frac{c}{n}$$

$$\begin{cases} E_R = \frac{n_1 - n_2}{n_1 + n_2} E_I \\ E_T = \frac{2n_1}{n_1 + n_2} E_I \end{cases}$$

So, we have got in this medium, which is epsilon 1 on one side and epsilon 2 on the other side, and therefore, there is some reflection and transmission, which are incident wave does not transmitted completely and we have got e reflected, it was $\frac{v_2 - v_1}{v_2 + v_1} e$ incident, and e transmitted is equal to $\frac{2v_2}{v_2 + v_1} e$ incident. These two relationships are very similar to the relationship obtained for waves on a string. Notice that if v_2 is less than v_1 , this implies e_r has opposite sign to e incident; that means, it is reflects direction on or there is a pie face change. Let us translate these equations, to equations in terms of the refractive index.

Now I know v is $\frac{c}{n}$, and therefore, e reflected is going to be $\frac{n_1 - n_2}{n_1 + n_2} e$ incident and e transmitted, is going to be $\frac{2n_1}{n_1 + n_2} e$ incident. Again you notice that if n_2 ; that is a medium two, has larger refractive index than medium 1, the reflected wave has a face change. This you have been taught in you eleventh twelfth grade, but now we see that this arise basically from the boundary condition on electric field and magnetic field.

(Refer Slide Time: 10:29)

Diagram showing an interface between two media. An incident wave with electric field E_I and wave speed v_1 is incident from the left. A reflected wave with electric field E_R and wave speed v_1 is reflected back to the left. A transmitted wave with electric field E_T and wave speed v_2 is transmitted to the right.

$$S_{\text{Incident}} = S_{\text{Reflected}} + S_T$$

$$\frac{1}{2} v_1 u_I = \frac{1}{2} v_1 u_R + \frac{1}{2} v_2 u_T$$

$$v_1 \epsilon_1 E_I^2 = v_1 \epsilon_1 E_R^2 + v_2 \epsilon_2 E_T^2$$

$$v_1 \epsilon_1 E_R^2 + v_2 \epsilon_2 E_T^2 = \left\{ v_1 \epsilon_1 \frac{(v_2 - v_1)^2}{(v_2 + v_1)^2} + \epsilon_2 v_2 \frac{4v_2^2}{(v_2 + v_1)^2} \right\} E_I^2$$

$$v = \frac{1}{\sqrt{\epsilon \mu_0}} \Rightarrow v^2 \epsilon = \frac{1}{\mu_0}$$

What about energy transmission. So, this wave is coming gets transmitted, gets reflected. I should have the pointing vector is coming in incident, should be equal to the energy which is transmitted plus the energy which is reflected, s reflected plus s transmitted. Incident 1 is going to be v_1 times u energy density incident one-half, this should be equal to one half v_1 u reflected plus one half v_2 u transmitted, which is indeed what the energy flow is. This half cancels. This is going to be equal to v_1 times ϵ_1 e incident square and the right hand side is going to be v_1 ϵ_1 times e reflected square plus v_2 ϵ_2 times e transmitted square. Let us see if this is true. Let us calculate the right hand side. Right hand side is v_1 ϵ_1 e reflected square plus v_2 ϵ_2 e transmitted square which is equal to v_1 ϵ_1 times v_2 minus v_1 square over v_2 plus v_1 square plus ϵ_2 v_2 times $4 v_2$ square over v_2 plus v_1 square times e I square. Now I know that v is equal to 1 over square root of $\epsilon \mu_0$. Keep in mind that μ is the same, and therefore v square ϵ is 1 over μ_0 for both the medium.

(Refer Slide Time: 12:50)

$$\begin{aligned}
 & v_1 \epsilon_1 \left(\frac{v_2 - v_1}{v_2 + v_1} \right)^2 + \epsilon_2 v_2 \cdot \frac{4v_2^2}{(v_2 + v_1)^2} \\
 &= \frac{1}{\mu_0} \cdot \frac{1}{v_1} \left(\frac{v_2 - v_1}{v_2 + v_1} \right)^2 + \frac{1}{\mu_0} \cdot \frac{4v_2^2}{(v_2 + v_1)^2} \\
 &= \frac{1}{\mu_0 v_1} \frac{1}{(v_2 + v_1)^2} \left[\underbrace{(v_2 - v_1)^2 + 4v_1 v_2}_{(v_1 + v_2)^2} \right] \\
 &= \frac{1}{\mu_0 v_1} \\
 & \boxed{\frac{1}{\mu_0 v_1} \cdot E_i^2 = v_1 \epsilon_1 E_i^2}
 \end{aligned}$$

And therefore, I can write this whole thing as; $v_1 \epsilon_1$ that is $v_2 - v_1$ over $v_2 + v_1$ plus v_1 whole square plus $\epsilon_2 v_2 \cdot 4 v_2^2$ square over $v_2 + v_1$ whole square as 1 over $\mu_0 v_1$ over $v_2 + v_1$ $v_2 - v_1$ over $v_2 + v_1$ whole square plus $\epsilon_2 v_2$ square is 1 over $\mu_0 v_1$ $4 v_2^2$ over $v_2 + v_1$ whole square. This is equal to 1 over $\mu_0 v_1$ $v_2 + v_1$ whole square, and inside I get $v_2 - v_1$ whole square plus $4 v_1 v_2$. This term is nothing but $v_1 + v_2$ whole square in this cancels with this term, and therefore, I get 1 over $\mu_0 v_1$. So, this whole things add up to 1 over $\mu_0 v_1$ E_i^2 incident square, which is nothing but equal to $v_1 \epsilon_1 E_i^2$ incident square as can be easily seen. So, you see that our amplitude, are such that they also satisfy, energy conservation. So, what I have shown you in this lecture is, through the boundary condition, when an incident electromagnetic wave comes, it gets both reflected as well as transmitted. The ratios of transmitted and reflected electric field have been calculated, and you also shown through those that energy is conserved.
