$$\sum_n \epsilon_{ijk} \epsilon_{ilm} = \epsilon_{1jk} \epsilon_{1lm} + \epsilon_{2jk} \epsilon_{2lm} + \epsilon_{3jk} \epsilon_{3lm}$$

$$= \delta_{jl} \delta_{km} - \delta_{jm} \delta_{kl}$$

---

(1)  $\vec{A} \cdot (\vec{B} \times \vec{C}) = \vec{C} \cdot (\vec{A} \times \vec{B}) = \vec{B} \cdot (\vec{A} \times \vec{C})$

$$\vec{A} \cdot (\vec{B} \times \vec{C}) = \sum_i A_i (\vec{B} \times \vec{C})_i$$

$$\vec{A} \cdot (\vec{B} \times \vec{C}) = \sum_k \sum_j \sum_i A_i \epsilon_{ijk} B_j C_k$$

$$= \sum_j \sum_k \sum_i B_j \epsilon_{ijk} A_i C_k$$

One problem I am going to do is prove that  $\vec{A} \cdot (\vec{B} \times \vec{C})$  is same as  $\vec{C} \cdot (\vec{A} \times \vec{B})$  is same as  $\vec{B} \cdot (\vec{A} \times \vec{C})$ . All right? So let us do that. Let us take  $\vec{A} \cdot (\vec{B} \times \vec{C})$  which is going to be nothing but  $\sum_i A_i (\vec{B} \times \vec{C})_i$  by definition of dot product which I can write as summation over  $i$   $A_i \epsilon_{ijk} B_j C_k$ . All right?

And then I am summing over  $J$ , I am summing over  $K$ . So  $\vec{A} \cdot (\vec{B} \times \vec{C})$  is equal to this. Now let us see what do we do next? Next what I can do is I can change the order. Let me write this in the form of summation  $\sum_j \sum_k \sum_i A_i \epsilon_{ijk} B_j C_k$ . This is commutative.  $\sum_j \sum_k \sum_i A_i \epsilon_{ijk} B_j C_k$ . All right? So now I will sum over  $B_j$  later and I will 1<sup>st</sup> sum over  $i$  and  $K$ .

(Refer Slide Time: 2:07)

Handwritten mathematical derivation on a whiteboard:

$$\vec{A} \cdot (\vec{B} \times \vec{C}) = \sum_j B_j \epsilon_{ijk} A_i C_k$$

$$\epsilon_{ikj} = -\epsilon_{ijk}$$

$$\rightarrow -\sum_j B_j \epsilon_{jik} A_i C_k$$

$$= -\sum_j B_j (\vec{A} \times \vec{C})_j$$

$$= -\vec{B} \cdot (\vec{A} \times \vec{C})$$

Since  $\vec{A} \times \vec{C} = -\vec{C} \times \vec{A}$

$$\vec{A} \cdot (\vec{B} \times \vec{C}) = \vec{B} \cdot (\vec{C} \times \vec{A}) = \vec{C} \cdot (\vec{A} \times \vec{B})$$

So what have we got? We have got A dot B cross C summation over JBJ Epsilon IJKAICK. I am now going to use the property that Epsilon IJK, this is another property which I did not say in the beginning, is always - Epsilon if I switch 2 of the indices, J I K. So I can write this as summation over J with a - sign BJ Epsilon JIKAICK which is nothing but equal to summation over JBJ times A cross CJ component with a - sign which is equal to B dot A cross C with a - sign.

Now since A cross C is equal to - C cross A I can equally well write this as equal to + B dot C cross A. So that is the answer, A dot B cross C is same as B dot C cross A. It goes in a cyclic manner. Right? So A dot B cross C the same as I bring C out dot A cross B is equal to B dot C cross A. What I wrote in the beginning in the previous page is not correct. So you can see how easily I could prove it.

(Refer Slide Time: 4:00)

The image shows a whiteboard with the following handwritten equations:

$$\vec{A} \times (\vec{B} \times \vec{C}) = (\vec{A} \cdot \vec{C}) \vec{B} - (\vec{A} \cdot \vec{B}) \vec{C}$$

$$[\vec{A} \times (\vec{B} \times \vec{C})]_i = \sum_{jk} \epsilon_{ijk} A_j (\vec{B} \times \vec{C})_k$$

$$= \sum_{lm} \sum_{jk} \epsilon_{ijk} A_j \epsilon_{klm} B_l C_m$$

$$[\vec{A} \times (\vec{B} \times \vec{C})]_i = \sum_{jklm} \epsilon_{ijk} \epsilon_{klm} \underbrace{A_j B_l C_m}_{\text{circled}}$$

$$= \sum_{jlm} \left[ \sum_k \epsilon_{ijk} \epsilon_{klm} \right] A_j B_l C_m$$

$$\sum_k \epsilon_{kij} \epsilon_{klm} = \delta_{il} \delta_{jm} - \epsilon_{im} \epsilon_{jl} \quad \left( \sum_k \epsilon_{kij} \epsilon_{klm} \right)$$

$$\epsilon_{ijk} = -\epsilon_{ikj} = +\epsilon_{kij}$$

Let me use another problem where I will use these symbols. Let us see what A cross B cross C is. How it can be expressed easily? I am going to show that this is A dot C times vector B - A dot B times vector C. Let us how I can do that. So let us take the Ith component of A cross B cross C. This is going to be equal to summation over J and K Epsilon IJKAJ times B cross C which is another vector, it is Kth component which I can write as summation J, K, Epsilon IJKAJ.

How do I express the Kth component of B cross C is going to be Epsilon KLMBLCM and I am going to sum over L and M. So this is the whole expression. Now I am going to use some properties of Epsilon products. So let us 1<sup>st</sup> express this again. A cross B cross C Ith component that is X, Y or Z component is equal to summation JKLM Epsilon IJK Epsilon KLMAJBLCM. Notice that AJBLCM, there is no K in it.

So I can write this as Epsilon JLM summed over and then write summation K K sum only over this IJK Epsilon KLMAJBLCM. K sum is only here. Now I know already, I gave you a property that Epsilon KIJ Epsilon KLM summed over K is nothing but delta IL because the direct terms delta JM - Epsilon IM Epsilon JL. So I want to bring this Epsilon KLM is okay, Epsilon IJK into KLM form.

Let us do that. Epsilon IJK, I can switch J and K and write this as Epsilon IKJ and pick up a - sign because now I have changed the direction in that circle in the clock. And again I can switch I and K and write this as Epsilon KIJ with a + sign. So now I have the sum is nothing but

summation over K Epsilon KIJ Epsilon KLM. That is nothing but this delta function. Sorry this is the delta function. I am sorry, this is the delta function. All right?

(Refer Slide Time: 7:43)

The whiteboard shows the following derivation:

$$\begin{aligned}
 [\vec{A} \times (\vec{B} \times \vec{C})]_i &= \sum_{jlm} [\delta_{il} \delta_{jm} - \delta_{im} \delta_{jl}] A_j B_l C_m \\
 &= \sum_{jlm} \delta_{il} \delta_{jm} A_j B_l C_m - \sum_{jlm} \delta_{im} \delta_{jl} A_j B_l C_m \\
 &= (\vec{A} \cdot \vec{C}) B_i - (\vec{A} \cdot \vec{B}) C_i
 \end{aligned}$$

Below this, the second term is expanded:

$$\begin{aligned}
 \sum_{jlm} \delta_{il} \delta_{jm} A_j B_l C_m &= \sum_{jl} \delta_{il} A_j B_l C_j \\
 &= \sum_j A_j B_i C_j \\
 &= [\sum_j (A_j C_j)] B_i \\
 &= (\vec{A} \cdot \vec{C}) B_i
 \end{aligned}$$

Similarly, the first term is expanded:

$$\begin{aligned}
 \sum_{jlm} \delta_{im} \delta_{jl} A_j B_l C_m &= \sum_{jl} \delta_{im} A_j B_l C_l \\
 &= \sum_j A_j B_j C_i \\
 &= (\vec{A} \cdot \vec{B}) C_i
 \end{aligned}$$

Finally, the result is summarized as:

$$\vec{A} \times (\vec{B} \times \vec{C}) = (\vec{A} \cdot \vec{C}) \vec{B} - (\vec{A} \cdot \vec{B}) \vec{C}$$

So I can now easily express A cross B cross C Ith component as delta IL delta JM - delta IM delta JL from the previous is AJLBJCM summation over JL and M. Notice I have to say over JL and M because on the left-hand side there is only Ith component. All J, L and M should go away. Let us see that what is it. This is summation JLM delta IL delta JM AJLBJCM - summation JLM delta IM delta JL AJLBJCM.

Let us do the sum. Let us take the 1<sup>st</sup> term, summation JLM delta IL delta JM AJLBJCM. When I sum over J or M, let us sum over M 1<sup>st</sup>. M delta JM is equal to 1 if M equals J and 0 otherwise. So what this delta is doing is forcing M to be equal to J. So this is going to be equal to summation JL delta IL M when I sum over, it makes M equal to J.

So this is going to be AJLBJCJ. If M is not equal to J, this term gives me 0. Similarly, now if I take delta IL is equal to 1 if L equals to I, 0 otherwise. So this is going to be I am going to sum over L I am going to get summation over J delta IL forces L to be equal to I. So I get AJBICJ which I can write as summation JAJCJBI.

Summation JAJCJ which is A1C1 + A2C2 + A3C3 as nothing but A dot C BI. So you can see that the 1<sup>st</sup> term is nothing but A dot CBI. Similarly, let leave it for you. You can show that this

will come out to be A dot B dot CI. So you can see that the Ith component of A cross B cross C is nothing but this dot product times BI, this dot product times CI.

So 1<sup>st</sup> component is going to be A dot CB1 - A dot BC1. 2<sup>nd</sup> component, A dot CB2 - A dot BC2. And therefore, in general you can therefore write A cross B cross C is equal to A dot C B vector - A dot B C vector.

(Refer Slide Time: 11:26)

$$\begin{aligned} \{ \vec{A} \times (\vec{B} \times \vec{C}) \} &= \sum_i (\vec{A} \times (\vec{B} \times \vec{C}))_i \hat{e}_i \\ &= \sum_i (\underline{A \cdot C}) B_i \hat{e}_i - \sum_i (\underline{A \cdot B}) C_i \hat{e}_i \\ &= (\underline{A \cdot C}) \sum_i B_i \hat{e}_i - (\underline{A \cdot B}) \sum_i C_i \hat{e}_i \\ &= (\underline{A \cdot C}) \vec{B} - (\underline{A \cdot B}) \vec{C} \end{aligned}$$

$$[\delta_{ij}] = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$\begin{aligned} \epsilon_{ijk} &= 1 \quad \text{if } \begin{matrix} 1 \rightarrow 2 \\ 2 \rightarrow 3 \\ 3 \rightarrow 1 \end{matrix} \\ &= -1 \quad \text{if } \begin{matrix} 1 \leftarrow 2 \\ 2 \leftarrow 3 \\ 3 \leftarrow 1 \end{matrix} \\ &= 0 \quad \text{if any two sub. are same} \end{aligned} \quad \& \quad \begin{aligned} \epsilon_{ijk} &= -\epsilon_{ikj} \\ &= -\epsilon_{jki} \end{aligned}$$

If you are very fussy about the notation, then you can also write that A cross B cross C is nothing but summation IA cross B cross C Ith component unit vector in the Ith direction. And this is nothing but A dot C BIEI summation over I - summation over I A dot BCIEI. Now A dot C and A dot B are scalar quantities. So they come out. A dot C summation I BIEI - A dot B summation I CIEI.

And these are nothing but A dot C. This is vector B - A dot B. That is your answer. So what I have tried to give you through these symbols and delta IJ which is in the matrix form an identity matrix 0, 0, 0, 0, 0 or symbolic Epsilon IJK which is 1 if let me make this symbol, 1, 2, 3 if you make a combination of 1, 2, 3 and going clockwise it is - 1.

If you make 1, 2, 3 combination counterclockwise or anticlockwise direction is 0 if any two subscripts are same. And Epsilon IJK is equal to - Epsilon IKJ or it is also equal to - Epsilon JIK. Using this, how we can make vector operations simpler to handle.
