Lecture – 10
Wave propagation in anisotropic media (Contd.)

(Refer Slide Time: 00:26)

Contents

- ✓ wave refractive index and polarisation
- ✓ Propagation of plane waves along z –direction
- ✓ Propagation of plane wave in the xz – plane

IIT KHARAGPUR | NPTEL ONLINE CERTIFICATION COURSES | Partha Roy Chaudhuri
Physics

We are discussing the propagation of electromagnetic waves in anisotropic media. And in the last section, we have discussed how we can represent the direction of propagation of the electromagnetic waves, when it is given then to determine the refractive wave refractive indices and the direction of the d vectors. So, we will make use of that characteristic equation to solve the direction of the d vectors as well as the wave refractive indices.

So, the direction of the d vectors which are the direction of the polarisation that we will discuss in this connection; then we will consider two example cases: one is along the direction of propagation of the electromagnetic waves in the z direction which is a simple case and then slightly different case when the electromagnetic wave is propagating in the xz plane.

(Refer Slide Time: 01:34)

Wave refractive index

Let's recall the matrix equation:

$$\begin{pmatrix} \frac{1}{n_\omega^2} K_x - k_y^2 - k_z^2 & k_x k_y & k_x k_z \\ k_y k_x & \frac{1}{n_\omega^2} K_y - k_x^2 - k_z^2 & k_y k_z \\ k_x k_z & k_y k_x & \frac{1}{n_\omega^2} K_z - k_x^2 - k_y^2 \end{pmatrix} \begin{pmatrix} E_x \\ E_y \\ E_z \end{pmatrix} = 0$$

NPTEL ONLINE
CERTIFICATION COURSES

Partha RoyChaudhuri
Physics

So, we have seen this characteristic equation that is an equation which has similar diagonal elements and similar half diagonal elements connected with this E_x , E_y and E_z equal to 0. So, this matrix the determinant value of this matrix will be equal to 0 for the non-trivial solution for this n_ω square, the refractive index indices of associated with the wave.

(Refer Slide Time: 01:57)

Wave refractive index

Then recall the eigenvalue equation:

$$\begin{vmatrix} \frac{1}{n_\omega^2} K_x - k_y^2 - k_z^2 & k_y k_x & k_z k_x \\ k_y k_x & \frac{1}{n_\omega^2} K_y - k_x^2 - k_z^2 & k_y k_z \\ k_x k_z & k_y k_x & \frac{1}{n_\omega^2} K_z - k_x^2 - k_y^2 \end{vmatrix} = 0$$

Given the propagation direction

If the wave propagates along **z** – direction

- ✓ what is the determinant equation?
- ✓ what the quadratic equation yields for n_{ω}^2 ?
- ✓ what are possible the directions of \vec{E} field ?

If the wave propagates in the **xz** – plane

- ✓ what happens then ?

IIT KHARAGPUR

NPTEL ONLINE

Partha RoyChaudhuri
Physics

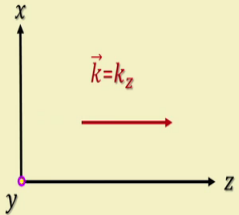

So, now we will consider the propagation of the wave along the z direction. So, given the direction of propagation that is along the z direction now, we will see how this determinant equation simplifies by plugging in the properties of the values of k_x , k_y and k_z . Then we will look at the quadratic equation which is a result of this determinant and the solution of the quadratic equation that is the two values of n_{ω} , the wave refractive indices. Then knowing that how we can extract the electric field direction from there; so, and then there after we will also discuss the case of the wave which is propagating along the xz direction.

(Refer Slide Time: 03:09)

Wave propagating along z – direction

In this case: $k_x = 0$, $k_y = 0$ and $k_z = 1$

IIT KHARAGPUR

NPTEL ONLINE
CERTIFICATION COURSES

Partha RoyChaudhuri
Physics

So, when the wave is propagating along z direction then you have k_z is equal to 1, the only component which survives because there is no component k_x or the component k_y both put equal to 0. Therefore, so the wave is travelling in the z direction we should look at the schematic representation of the wave propagation.

(Refer Slide Time: 03:39)

Wave propagating along z – direction

Using $k_x = 0$, $k_y = 0$ and $k_z = 1$

$$\begin{vmatrix} \frac{1}{n_0^2} K_x - k_x^2 - k_z^2 & k_y k_x & k_z k_x \\ k_y k_x & \frac{1}{n_0^2} K_y - k_y^2 - k_x^2 & k_y k_z \\ k_x k_z & k_y k_z & \frac{1}{n_0^2} K_z - k_x^2 - k_y^2 \end{vmatrix} = 0 \Rightarrow \begin{vmatrix} \frac{1}{n_0^2} K_x - 1 & 0 & 0 \\ 0 & \frac{1}{n_0^2} K_y - 1 & 0 \\ 0 & 0 & \frac{1}{n_0^2} K_z \end{vmatrix} = 0$$

Partha RoyChaudhuri
Physics

So, we use this values k_x equal to 0, k_y equal to 0, but k_z equal to 1. This equation will take the shape of this because k_x equal to 0. So, this will make this quantity this term 0, this term also 0, k_x will make this term 0, k_x will make this term 0, k_y will make this term 0. So, 1 2 3 plus 3 so, all 6 of diagonal terms will be equal to 0.

So, you have determinants now for this case that is the case of wave propagating along the z direction which is which will look like this, that the diagonal elements of the determinant will be put equal to 0. So from these equations, if I open the bracket then I can write in this form this quantity into this into this minus 0 will be equal to 0.

(Refer Slide Time: 04:51)

Wave refractive indices

$$\left(\frac{1}{n_{\omega}^2} K_x - 1\right) \left(\frac{1}{n_{\omega}^2} K_y - 1\right) \frac{1}{n_{\omega}^2} K_z = 0$$

this yields two roots for n_{ω} : $n_{\omega 1} = \sqrt{K_x}$ $n_{\omega 2} = \sqrt{K_y}$

- ✓ eigenvalues $n_{\omega 1}$ and $n_{\omega 2}$ represent **two** wave refractive indices
- ✓ corresponding to the waves propagating along the **z** - direction
- ✓ **2 wave RI's** depend on the relative permittivities along **x** and **y**

IIT KHARAGPUR NPTEL ONLINE CERTIFICATION COURSES Partha RoyChaudhuri
Physics

So, I have done that $\frac{1}{n_{\omega}^2} K_x - 1$ into $\frac{1}{n_{\omega}^2} K_y - 1$ into $\frac{1}{n_{\omega}^2} K_z = 0$ because, this quantity does not have any minus 1; so, this into this into this the product of these 3 quantities. So, if you if you now multiply this will yield two roots of n_{ω} which will be n_{ω} because, anyway this quantity will be put equal to 0 or this quantity will be equal to 0 or this will be equal to 0.

But, in any case n_{ω} is not 0 in general because we are looking for a finite value solution and K_z cannot be 0. So, this quantity cannot be 0; so either this is equal to 0 or this bracketed quantity will be equal to 0. So, this the first one yields that the value of n_{ω} must be equal to under root of K_x and from the second one we find that the value of $n_{\omega 2}$ will be under root of K_y .

So, we have two refractive indices for the case of wave propagation in the z direction and the wave is propagation the z direction, the refractive indices that is seen by wave is under root of K_x and under root of K_y . So, simply it indicates that the refractive indices are associated with the permittivity of the medium along x direction and along y direction, the wave is propagating along the z direction.

So, the eigenvalues $n_{\omega 1}$ and $n_{\omega 2}$ these two values are the two refractive indices seen by such a wave which is travelling along the z direction. And, the corresponding waves that represents that is that see is the refractive indices values of this

and these are the two directions of the polarisations. The 2 wave refractive indices depend on the relative permittivities along x and along y. So, the wave is along z direction, but the refractive indices are due to x and y direction. So, this is very interesting.

(Refer Slide Time: 07:40)

Polarisation directions

substituting $n_{\omega 1}$ and $n_{\omega 2}$ in the eigen value equation

$$n_{\omega 1} = \sqrt{K_x} \quad n_{\omega 2} = \sqrt{K_y}$$

- ✓ the respective eigenvectors E_x, E_y or E_z can be found
- ✓ hence, the **polarization directions** can be determined

IIT KHARAGPUR | NPTEL ONLINE CERTIFICATION COURSES | Partha RoyChaudhuri | Physics

So, substituting the value of $n_{\omega 1}$ equal to this and $n_{\omega 2}$ equal to this in the eigenvalue equation we can find out the respective eigenvectors E_x, E_y and E_z . So, this discussion is very interesting to know that given the refractive indices, then how we can obtain, we can find out the eigenvectors that is the direction of the E_x, E_y or E_z whichever is surviving. and these directions will be called the polarisation directions.

So, by knowing their refractive indices we can calculate the direction of the electric fields and hence, we can also calculate the direction of polarisation of the wave when the direction of propagation of the wave is given.

(Refer Slide Time: 08:37)

Polarisation directions

for the wave having refractive index: $n_{\omega 1} = \sqrt{K_x}$

the 2nd equation gives: $k_y k_x E_x + \left(\frac{1}{n_{\omega}^2} K_y - k_x^2 - k_z^2 \right) E_y + k_z k_y E_z = 0$

$k_x = k_y = 0$ \Rightarrow $0 \cdot E_x + \left(\frac{1}{K_x} K_y - 1 \right) E_y + 0 \cdot E_z = 0$

$k_z^2 = k^2 = 1$

now since $K_x \neq K_y \Rightarrow E_y = 0$ $\left(\frac{1}{K_x} K_y - 1 \right) E_y = 0$

So, let us first use the value of $n_{\omega 1}$ equal to the under root of K of x that is the permittivity along the x direction. So, if we use this value in the second eigenvalue equation remember that second eigenvalue equation look like this. So, $k_y k_x E_x$, but out of this because k_x and k_y are 0 so, this quantity will become 0. So, 0 into E_x , but now k_x^2 is also 0 so, this minus k_z^2 k_z^2 is equal to 1 so, this minus 1.

So, I have written exactly that, but n_{ω}^2 I have use the value of $n_{\omega 1}$. So, that is equal to 1 by K_x into K_y minus 1 into E_y equal to 0 and for the third terms, since k_y equal to 0 so, we have 0 into E_z equal to 0. So, this is the reduced form of the first equation where we have used the appropriate values of k_x k_y k_z and also the $n_{\omega 1}$; the value of the n_{ω} , then only this quantity has to be 0. If it is so, because K_x and K_y in general they are not equal; that means, E_y must be equal to 0.

So, let us understand this situation that a wave is travelling along z direction and its see is a refractive index which corresponds to the permittivity along the x direction, then the field E_y is not there. And because, it is propagating along the z direction, so therefore E_z is also not there will see that. So, the only possibilities that E_y is not equal E_x is not equal to 0. So, this consequence of $n_{\omega 1}$ is equal to under root of K_x the permittivity along the x direction is that E_y cannot be existing. So, E_y must be equal to

0. So, the wave is travelling along the z direction, the refractive index seen by this wave is n_x and there is no E_y . So, it is only the E_x which is surviving.

(Refer Slide Time: 11:13)

Looking for eigenvectors

for the wave having refractive index: $n_{\omega 1} = \sqrt{K_x}$

the 3rd equation gives: $k_x k_z E_x + k_y k_z E_y + \left(\frac{1}{n_{\omega}^2} K_z - k_x^2 - k_y^2 \right) E_z = 0$

$k_x = k_y = 0$ ↗
 $k_z^2 = k^2 = 1$

$0 \cdot E_x + 0 \cdot E_y + \frac{1}{K_x} K_z E_z = 0$
 $\frac{1}{K_x} K_z \cdot E_z = 0$

now since $K_x, K_z \neq 0 \Rightarrow E_z = 0$

IIT KHARAGPUR

NPTEL ONLINE
CERTIFICATION COURSES

Partha RoyChaudhuri
Physics

So, let us use this refractive index values the wave refractive index values when we plug in to the second third equation. Again this quantity is equal to 0 because k_x equal to 0, k_y is also equal to 0 so, this is equal to 0; so, 0 into E_x 0 into E_y and here this quantity and this quantity both of them are equal to 0. So, if we write this equation we get 0 into E_x 0 into E_y plus 1 by K_x K_z E_z equal to 0.

That means, K_z by K_x into E_z equal to 0; it simply tells you that because K_z and K_x they are whatever might be the value of this they cannot be 0. So, E_z must be 0. So, for a wave we have seen two consequences one is E_y cannot be 0, E_z cannot be 0 the wave is travelling along the x direction. So, the only possibility is E_x not equal to 0.

(Refer Slide Time: 12:21)

Eigenvectors

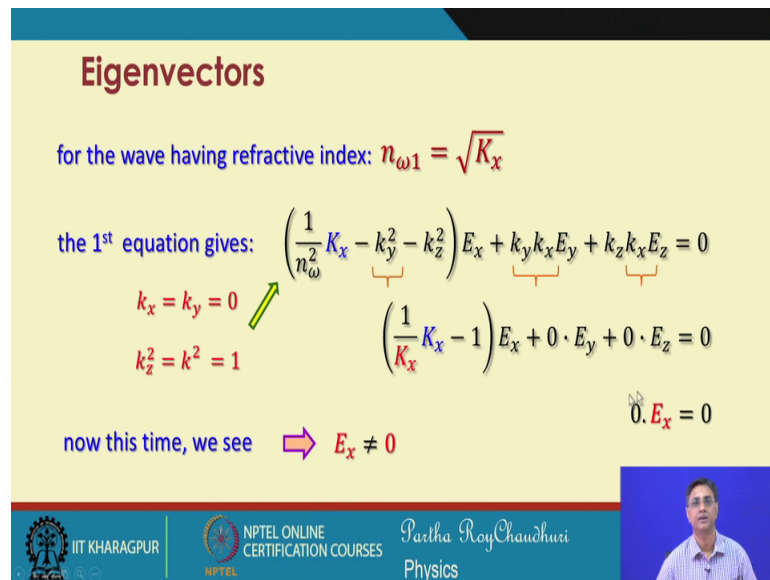

for the wave having refractive index: $n_{\omega 1} = \sqrt{K_x}$

the 1st equation gives: $\left(\frac{1}{n_{\omega}^2} K_x - k_y^2 - k_z^2\right) E_x + k_y k_x E_y + k_z k_x E_z = 0$

$k_x = k_y = 0$ \Rightarrow $\left(\frac{1}{K_x} K_x - 1\right) E_x + 0 \cdot E_y + 0 \cdot E_z = 0$

$k_z^2 = k^2 = 1$ \Rightarrow $0 \cdot E_x = 0$

now this time, we see $\Rightarrow E_x \neq 0$

The slide features a yellow background with a blue header and footer. The header contains the title 'Eigenvectors'. The main content area contains mathematical derivations. A small inset video of the speaker is in the bottom right corner. The footer includes logos for IIT Kharagpur and NPTEL, along with the speaker's name 'Partha RoyChaudhuri' and 'Physics'.

Let us see that when I use the first equation and I use the same refractive index values a wave refractive index then because this quantity is equal to 0, this is also equal to 0 and this equal to 0. So, in the same way we can write this equation that K_x by K_x minus 1 E_x plus 0 into E_y plus 0 into E_z equal to 0. As a result this quantity because, this is 1 minus 1 equal to 0 so, 0 into E_x is equal to 0; that means E_x not equal to 0.

(Refer Slide Time: 13:02)

Looking for eigenvectors

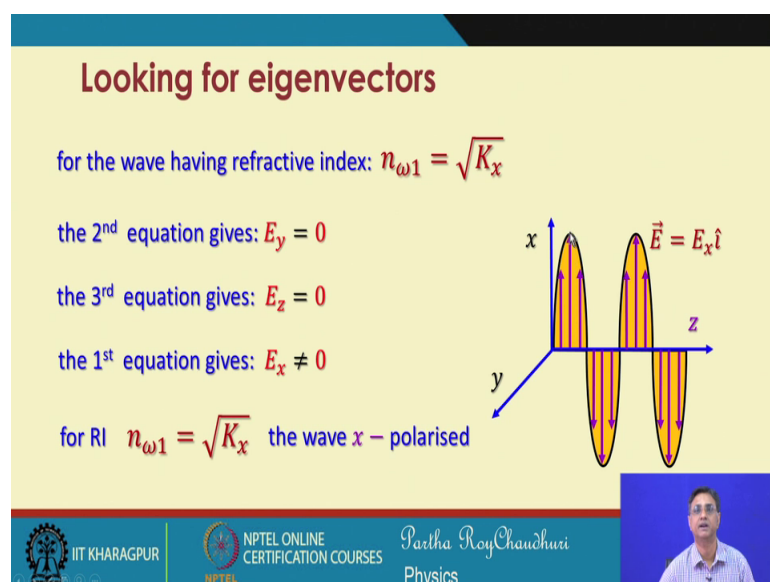

for the wave having refractive index: $n_{\omega 1} = \sqrt{K_x}$

the 2nd equation gives: $E_y = 0$

the 3rd equation gives: $E_z = 0$

the 1st equation gives: $E_x \neq 0$

for RI $n_{\omega 1} = \sqrt{K_x}$ the wave x - polarised

The slide features a yellow background with a blue header and footer. The header contains the title 'Looking for eigenvectors'. The main content area contains mathematical derivations and a diagram of an x-polarized wave. A small inset video of the speaker is in the bottom right corner. The footer includes logos for IIT Kharagpur and NPTEL, along with the speaker's name 'Partha RoyChaudhuri' and 'Physics'.

So therefore, therefore for a wave which is travelling along x direction, I find that the refractive index seen by this the wave refractive index seen by this waved is due to the

electric field which is along the x direction. And the value of the refractive index is due to the permittivity for value of the medium along the x direction. So, the second equation gives E_y equal to 0, third equation gives E_z equal to 0 and the first equation gives E_x not equal to 0.

So, you have only E_x associated with the wave which is travelling along z direction, if the solution you assume is due to the permittivity along due to the refractive index seen by the wave along the x direction. So, such a wave this called x polarised because, the displacement vector or the electric field vector, they are along the same along this direction. For the wave having refractive index $n_{\omega 2}$ is equal to under root of K_y , that is if I use the other solution that is the other root then an if we proceed in the same way that is k_x is equal to k_y equal to 0 this quantity become 0; we can write 0 into E_x and similarly this quantities 0, but this is equal to 1.

So, we can write K_y upon K_y minus 1 into E_y and for this quantity because k_y equal to 0, we can write 0 into E_z equal to 0. It simply means that this quantity 1 minus 1 which is equal to 0 into E_y equal to 0; that means, E_y cannot be 0. We can use the refractive index value in the other 2 equations, that is equation 1 and equation 2 to identify that in such a situation it is only E_y that is not equal to 0, but E_x and E_z they are equal to 0.

(Refer Slide Time: 15:15)

Polarisation directions

for the wave having refractive index: $n_{\omega 2} = \sqrt{K_y}$

Proceeding in the similar way.....

for RI $n_{\omega 2} = \sqrt{K_y}$ the wave y – polarised

IIT KHARAGPUR | NPTEL ONLINE CERTIFICATION COURSES | Partha RoyChaudhuri | Physics

So, when you consider the property when you consider the solution for the wave refractive index $n_{\omega 2}$ is due to the permittivity along the y direction, then it is only the y field y electric field that survives and the propagation is along the z direction. So, the refractive index $n_{\omega 2}$ equal to K_y it gives you a y polarised light.

(Refer Slide Time: 15:45)

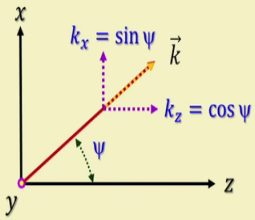

So, we can now find out that when the wave is travelling along the z direction, this wave can see a refractive index wave refractive index which is along the x direction. And, given by this permittivity square root and the electric field is along this x direction. This wave can have because, it has two solutions this wave can have a refractive index value associated with is with it is n_{ω} equal to under root of K_y and the electric field is directed along the E_y .

So, this wave which is travelling along z direction can have two polarisations that is E_x and E_y . And, the corresponding refractive indices $n_{\omega 1}$ and $n_{\omega 2}$ are given by these 2 equations. So, when the wave is travelling along travelling in the z direction with the electric filed E_x that is this is the x polarised wave and this is the y polarised to wave. So, there are two possible polarisations associated with the wave which is travelling along a direction z.

(Refer Slide Time: 17:04)

Wave propagating in xz – plane

In this case: $k_x = \sin \psi$, $k_y = 0$ and $k_z = \cos \psi$

The diagram illustrates a 3D coordinate system with x, y, and z axes. A red vector \vec{k} originates from the origin and lies in the xz-plane. A dashed line from the tip of \vec{k} to the x-axis indicates the component $k_x = \sin \psi$. A dashed line from the tip of \vec{k} to the z-axis indicates the component $k_z = \cos \psi$. The angle between \vec{k} and the z-axis is labeled ψ . The y-axis is shown but has no component of \vec{k} .

IIT KHARAGPUR | NPTEL ONLINE CERTIFICATION COURSES | Partha RoyChaudhuri
Physics

And now, we will consider the other situation that is when the travel wave is travelling in a in a general direction in the xz plane, that is it makes an angle of it makes an angle of phi equal to theta plus phi where theta is the angle of the point angle that the pointing vector makes with the z axis and phi is the angle that the direction the ray direction and the wave direction they make with each other. That is the wave direction is given by k vector whereas, the ray vector that the ray direction that is the pointing vector is given by S . So, this angle is phi the same notation that we have used earlier.

So, in this case when the wave is propagating along xz plane we can write that because, this is your k vector we can decompose the vector along the z direction, this is the angle psi. So, k_z will be equal to cosine psi and k_x will be equal to sin psi. So, now we will use the value of k_x and k_y and k_z in the eigenvalue equation that is the determinant equation.

(Refer Slide Time: 18:23)

Wave refractive index

Now recall the eigenvalue equation:

$$\begin{vmatrix} \frac{1}{n_\omega^2} K_x - k_y^2 - k_z^2 & k_y k_x & k_z k_x \\ k_y k_x & \frac{1}{n_\omega^2} K_y - k_z^2 - k_x^2 & k_y k_z \\ k_x k_z & k_y k_z & \frac{1}{n_\omega^2} K_z - k_x^2 - k_y^2 \end{vmatrix} = 0$$

IIT KHARAGPUR

NPTEL ONLINE
CERTIFICATION COURSES

Partha RoyChaudhuri
Physics

So, if I do that this K_x k_y and k_z we plug-in to this equation, then it will take these values that $\frac{1}{n_\omega^2} K_x - \cos^2 \psi$, $\frac{1}{n_\omega^2} K_x - \cos^2 \psi - 0$ $\sin \psi \cos \psi$.

(Refer Slide Time: 18:35)

Wave propagating along z – direction

Using: $k_x = \sin \psi$, $k_y = 0$ and $k_z = \cos \psi$

$$\begin{vmatrix} \frac{1}{n_\omega^2} K_x - k_x^2 - k_z^2 & k_y k_x & k_z k_x \\ k_y k_x & \frac{1}{n_\omega^2} K_y - k_z^2 - k_x^2 & k_y k_z \\ k_x k_z & k_y k_z & \frac{1}{n_\omega^2} K_z - k_x^2 - k_y^2 \end{vmatrix} = 0 \Rightarrow \begin{vmatrix} \frac{1}{n_\omega^2} K_x - \cos^2 \psi & 0 & \sin \psi \cos \psi \\ 0 & \frac{1}{n_\omega^2} K_y - 1 & 0 \\ \sin \psi \cos \psi & 0 & \frac{1}{n_\omega^2} K_z - \sin^2 \psi \end{vmatrix} = 0$$

IIT KHARAGPUR

NPTEL ONLINE
CERTIFICATION COURSES

Partha RoyChaudhuri
Physics

And similarly, this you can see the diagonal elements which are almost symmetric this x x component and z z component; they are the same. But this y y component is slightly different because, this k_z and k_x they are having the values whereas, k_y this 0.

(Refer Slide Time: 19:15)

$$\begin{vmatrix} \frac{1}{n_{\omega}^2}K_x - \cos^2 \psi & 0 & \sin \psi \cos \psi \\ 0 & \frac{1}{n_{\omega}^2}K_y - 1 & 0 \\ \sin \psi \cos \psi & 0 & \frac{1}{n_{\omega}^2}K_z - \sin^2 \psi \end{vmatrix} = 0$$

$$\left(\frac{K_x}{n_{\omega}^2} - \cos^2 \psi\right)\left(\frac{K_y}{n_{\omega}^2} - 1\right)\left(\frac{K_z}{n_{\omega}^2} - \sin^2 \psi\right) - \sin^2 \psi \cos^2 \psi \left(\frac{K_y}{n_{\omega}^2} - 1\right) = 0$$

$$\left(\frac{K_y}{n_{\omega}^2} - 1\right)\left[\left(\frac{K_x}{n_{\omega}^2} - \cos^2 \psi\right)\left(\frac{K_z}{n_{\omega}^2} - \sin^2 \psi\right) - \sin^2 \psi \cos^2 \psi\right] = 0$$

So, from this determinant equation if you open up this determinant we can write this equation in this from this into this into this minus 0. So, that is what I have written K_x by n_{ω}^2 minus cosine square ψ and this. So, this into this into this I have written and there will be one more value that is for this into this.

So, we can write this equation because K_x by n_{ω}^2 minus cosine square ψ , K_y by n_{ω}^2 minus 1 and K_z by n_{ω}^2 minus sine square ψ it appears in both the terms. So, I take them out and we put these remaining quantities in the bracket that is K_x by n_{ω}^2 minus cosine square ψ and this remaining part of this equation that is sine square ψ cosine square ψ equal to 0.

(Refer Slide Time: 20:31)

Wave refractive indices

Simplifying.....

$$\left(\frac{K_y}{n_\omega^2} - 1\right) \left[\frac{K_x K_z}{n_\omega^4} - \frac{K_x \sin^2 \psi}{n_\omega^2} - \frac{K_z \cos^2 \psi}{n_\omega^2} \right] = 0$$
$$\frac{1}{n_\omega^2} \left(\frac{K_y}{n_\omega^2} - 1\right) \left(\frac{K_x K_z}{n_\omega^2} - K_x \sin^2 \psi - K_z \cos^2 \psi \right) = 0$$

IIT KHARAGPUR | NPTEL ONLINE CERTIFICATION COURSES | Partha RoyChaudhuri
Physics

So, this reduced equation if I simplify then if I simplify this equation that is I again multiply this it will give you cosine square and sin square product which will cancel because, you have minus and minus input give you plus. So, sin square psi and cosine square psi will identically, when is there will be only x by n omega square sin psi K z by n omega square cosine psi with minus sin multiplied by this quantity.

So that is, what it appears that K y by n omega square minus 1 into this quantity is equal to 0. So, we get an equation which involves K x and K z because the wave is travelling in the x z plane. So, 1 by n omega square K y by n omega square minus 1 this quantity could be 0 or this quantity could be as well 0. So, we have two different possibilities the possibility that this quantity will be equal to 0; will give you a solution for n omega that is K y by n omega square minus 1 is equal to 0.

(Refer Slide Time: 21:44)

Wave refractive indices

$$\left(\frac{K_y}{n_\omega^2} - 1\right) = 0 \quad \text{and} \quad \left(\frac{K_x K_z}{n_\omega^2} - K_x \sin^2 \psi - K_z \cos^2 \psi\right) = 0$$

this yields two roots for n_ω : $n_{\omega 1} = \sqrt{K_y}$ $\frac{1}{n_{\omega 2}^2} = \frac{\cos^2 \psi}{K_x} + \frac{\sin^2 \psi}{K_z}$

- ✓ eigenvalues $n_{\omega 1}$ and $n_{\omega 2}$ represent **two** wave refractive indices
- ✓ corresponding to the waves that propagates in the **xz** - plane
- ✓ **2 wave RI's** depend on the relative permittivities along **x** and **z**

IIT KHARAGPUR NPTEL ONLINE CERTIFICATION COURSES Partha RoyChaudhuri
Physics

This will give you simply a solution that $n_{\omega 1}$ equal to $\sqrt{K_y}$. We will see what does it mean and in the case of this quantity becoming 0, we will see that $n_{\omega 1}^2$ by $n_{\omega 2}^2$ will be equal to $\cos^2 \psi$ by K_x plus $\sin^2 \psi$ by K_z . It is not simply the vector sum or the some of the square root of the permittivities. But, it enters into this equation in a very specific way in terms of cosine square ψ and sin square ψ .

So, the second root depends on K_x and K_z which involves the sin square and cosine square function of the angle that the wave makes with the ray direction in general in the xz plane. So, by doing this we have seen that there are two eigenvalues attached with this wave which is propagation in the xz plane. These are $n_{\omega 1}$ and $n_{\omega 2}$ and these two values are the two refractive indices seen by the wave. Corresponding to these two waves that that is propagation along xz plane there are 2 different relative permittivities corresponding to x and z directions.

(Refer Slide Time: 23:18)

Polarisation directions

substituting n_{ω_1} and n_{ω_2} in the eigen value equation

$$n_{\omega_1} = \sqrt{K_y} \quad \text{and} \quad \frac{1}{n_{\omega_2}^2} = \frac{\cos^2 \psi}{K_x} + \frac{\sin^2 \psi}{K_z}$$

- ✓ the respective eigenvectors E_x, E_y or E_z can be found
- ✓ hence, the **polarization directions** can be determined

Partha RoyChaudhuri
Physics

So, let us see that when you substitute this n_{ω_1} and n_{ω_2} , these two values are the two solutions of the determinant equation in the eigenvalue equation; then we can find that n_{ω_1} is equal to this and n_{ω_2} is equal to this quantity. So, these are the two respective eigenvalues for the wave which is propagating in the xz plane. And, the eigenvectors corresponding to these will be E_x, E_y and E_z which can also be found out by the same wave, we have done it for the z propagating wave. And hence, the polarisation directions can also be determined by doing the solutions n_{ω_1} and n_{ω_2} .

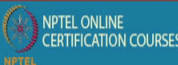

(Refer Slide Time: 24:06)

for the wave R1: $\frac{1}{n_{\omega_2}^2} = \frac{\cos^2 \psi}{K_x} + \frac{\sin^2 \psi}{K_z}$

$$\begin{vmatrix} \frac{1}{n_{\omega}^2} K_x - \cos^2 \psi & 0 & \sin \psi \cos \psi \\ 0 & \frac{1}{n_{\omega}^2} K_y - 1 & 0 \\ \sin \psi \cos \psi & 0 & \frac{1}{n_{\omega}^2} K_z - \sin^2 \psi \end{vmatrix} = 0$$

1st equation : $\left(\frac{1}{n_{\omega}^2} K_x - \cos^2 \psi\right) E_x + 0 \cdot E_y + \sin \psi \cos \psi \cdot E_z = 0$

$$\sin \psi \cos \psi \cdot E_z = \left(\cos^2 \psi - \frac{1}{n_{\omega}^2} K_x\right) E_x$$

$$\frac{E_z}{E_x} \sin \psi \cos \psi = \left(\cos^2 \psi - \frac{\cos^2 \psi}{K_x} K_x - \frac{\sin^2 \psi}{K_z} K_x\right)$$

Partha RoyChaudhuri
Physics

Let us try to look into that for the wave with refractive index $n_{\omega 1}$ that is the permittivity due to the y axis due along the y axis of the medium. Then if I use this solution in the second equation, you remember the second equation. So, we will we will get 0 into E_x 0 into E_x because, this equation itself is 0 and you have E_x outside. This quantity into E_y will be surviving and this is 0 into E_z is equal to 0 . So, in the second equation I have used the value of 1 by $n_{\omega 1}^2$ is equal to 1 by K_y that directly tells you that K_y by K_y minus 1 into E_y equal to 0 . So, if this quantity 0 so, y cannot be 0 the wave is y polarised.

That means when the wave see the refractive index which is due to the refractive index of the medium along the y axis so, then E_y field exists. So, E_y field it is the direction of the electric field that decides the refractive index of the medium, that is seen by the wave when travelling along that medium. So, this waved E_y which as a corresponding refractive index $n_{\omega 1}$ is y polarised.

(Refer Slide Time: 25:52)

One polarisation is along y

for the wave RI: $n_{\omega 1} = \sqrt{K_y}$

- ✓ the wave is y - polarised
- ✓ evidently \vec{D} will be along y

IIT KHARAGPUR | NPTEL ONLINE CERTIFICATION COURSES | Partha RoyChaudhuri
Physics

So, for one way for one solution of this wave is very straightforward that is that is when the refractive index is $n_{\omega 1}$ equal to under root K_y , then the wave is y polarised. The wave is y polarised and it seen the refractive index K_y and it makes an angle so, the other polarisation you will be this. Even though the wave is travelling along these direction, the direction of polarisation, the direction of the electric field vector is along

the y z plane. And it is pointing along the y direction and the value of the refractive index is square root of K_y .

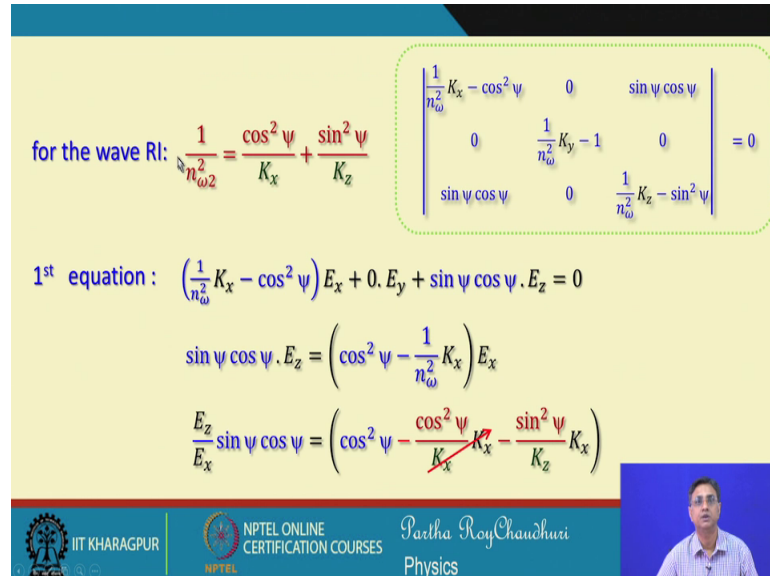

(Refer Slide Time: 26:30)

for the wave RI: $\frac{1}{n_{\omega}^2} = \frac{\cos^2 \psi}{K_x} + \frac{\sin^2 \psi}{K_z}$

$$\begin{vmatrix} \frac{1}{n_{\omega}^2} K_x - \cos^2 \psi & 0 & \sin \psi \cos \psi \\ 0 & \frac{1}{n_{\omega}^2} K_y - 1 & 0 \\ \sin \psi \cos \psi & 0 & \frac{1}{n_{\omega}^2} K_z - \sin^2 \psi \end{vmatrix} = 0$$

1st equation : $\left(\frac{1}{n_{\omega}^2} K_x - \cos^2 \psi\right) E_x + 0 \cdot E_y + \sin \psi \cos \psi \cdot E_z = 0$

$$\sin \psi \cos \psi \cdot E_z = \left(\cos^2 \psi - \frac{1}{n_{\omega}^2} K_x\right) E_x$$

$$\frac{E_z}{E_x} \sin \psi \cos \psi = \left(\cos^2 \psi - \frac{\cos^2 \psi}{K_x} K_x - \frac{\sin^2 \psi}{K_z} K_x\right)$$

Now, for the second solution that is $1/n_{\omega}^2$ is equal to these if I now substitute into the first equation, you can see that this equation into E_x second one second term is itself is 0 into E_y and third term you have this. So, if you arrange this equation $\sin x \cos x$ into E_z equal to this into E_x . So, E_z by E_x into $\sin x \cos x$ you can see that this quantity identically vanishes, where you use the value of $1/n_{\omega}^2$ equal to this. So, they will vanish.

(Refer Slide Time: 27:13)

for the wave RI: $\frac{1}{n_{\omega 2}^2} = \frac{\cos^2 \psi}{K_x} + \frac{\sin^2 \psi}{K_z}$

we find: $\frac{E_z}{E_x} \sin \psi \cos \psi = -\frac{\sin^2 \psi}{K_z} K_x \Rightarrow \frac{K_z E_z}{K_x E_x} = -\tan \psi$

Since in principal axes system: $D_x = \epsilon_0 \epsilon_x E_x$, $D_y = \epsilon_0 \epsilon_y E_y$ and $D_z = \epsilon_0 \epsilon_z E_z$

we obtain: $\frac{D_z}{D_x} = -\tan \psi$

Physics

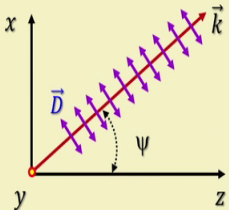

Therefore, for this value of the refractive index we find that E_z by $E_x \sin \psi$ equal to this and $E_z E_x$ by $K_z E_x$ equal to $\tan \psi$. So, it means that this quantity is the component of the dielectric displacement vector along the z direction and this is the component of the displacement vector along the x direction. So, they are inclined to each other at an angle of minus $\tan \psi$ which is an interesting finding.

(Refer Slide Time: 27:52)

that means

- ✓ \vec{D} of this wave is normal to y
- ✓ and normal to the direction of \vec{k}
- ✓ and \vec{D} lies in the xy -plane

$$\frac{D_z}{D_x} = -\tan \psi$$

IIT KHARAGPUR

NPTEL ONLINE CERTIFICATION COURSES

Partha RoyChaudhuri
Physics

So, you can see that when the wave is if you consider the solution the solution, the second solution that is $1/n_{\omega 2}^2$. This solution will give you a polarisation,

where the electric field vector the displacement vector lies in general in the x z plane. And, the D z and D x if you decompose these into two components D x and D D x and D z, this is this will be D z.

So, because it will be directed in the negative direction of the z so, D z by D z will give you this value of minus tan psi. So, the displacement vectors are inclined at an angle of psi with the direction of propagation of the wave.

(Refer Slide Time: 28:47)

thus the two polarisations:

- ✓ *y - polarisation*
 $RI = n_{\omega 1} = \sqrt{K_y}$
 shown by circles
- ✓ *xz - plane polarisation*
 $RI = \frac{1}{n_{\omega 2}^2} = \frac{\cos^2 \psi}{K_x} + \frac{\sin^2 \psi}{K_z}$
 shown by arrows

$\psi = \theta + \phi$

IIT KHARAGPUR | NPTEL ONLINE CERTIFICATION COURSES | Partha RoyChaudhuri | Physics

So, for y polarised wave you have a very specific case that it is directed along the y direction, but for the other polarisation which is in the in the x x z plane. So, thus yellow circles and this arrows denote the two polarisations corresponding to the two refractive indices seen by this wave.

(Refer Slide Time: 29:15)

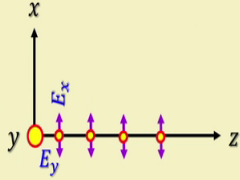

Check

Take $\psi = 0$

Then $\frac{1}{n_{\omega 2}^2} = \frac{\cos^2 \psi}{K_x} + \frac{\sin^2 \psi}{K_z}$

Gives $n_{\omega 2} = \sqrt{K_x}$

Also $n_{\omega 1} = \sqrt{K_y}$

- ✓ Thus the 2 polarisations are E_x and E_y
- ✓ With RI's $n_{\omega 2} = \sqrt{K_x}$ and $n_{\omega 1} = \sqrt{K_y}$

IIT KHARAGPUR | NPTEL ONLINE CERTIFICATION COURSES | Partha RoyChaudhuri | Physics

So, that is a check point that if you take psi equal to 0 then you can get this quantity equal to 1, this equal to 0. So, n omega 2 becomes exactly this. So that means, if you take that wave is propagating along z direction you end up with the earlier possibilities that the 2 polarisations are along x and y direction and these are the 2 refractive index indices.

(Refer Slide Time: 29:41)

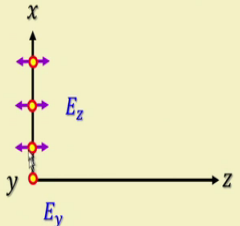

Check

Take $\psi = \frac{\pi}{2}$

Then $\frac{1}{n_{\omega 2}^2} = \frac{\cos^2 \psi}{K_x} + \frac{\sin^2 \psi}{K_z}$

Gives $n_{\omega 2} = \sqrt{K_z}$

Also $n_{\omega 1} = \sqrt{K_y}$

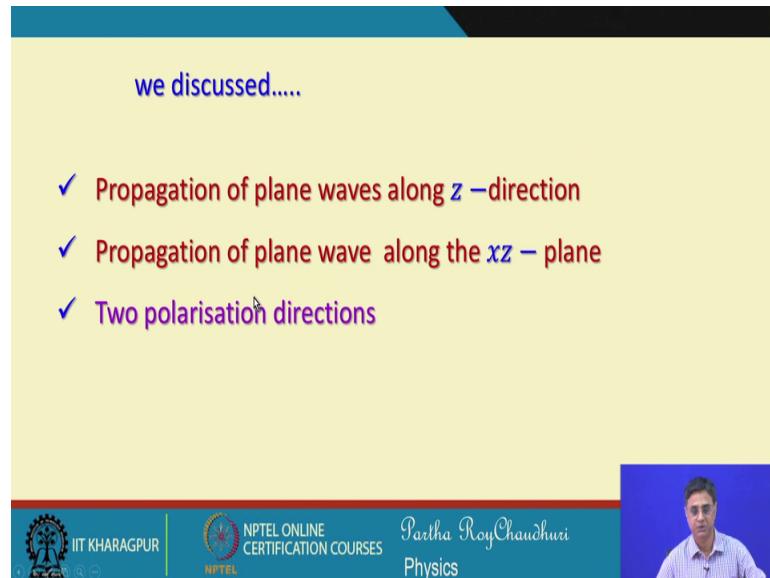

- ✓ Thus the 2 polarisations are E_y and E_z
- ✓ With RI's $n_{\omega 2} = \sqrt{K_z}$ and $n_{\omega 1} = \sqrt{K_y}$

IIT KHARAGPUR | NPTEL ONLINE CERTIFICATION COURSES | Partha RoyChaudhuri | Physics

And if you put psi equal to pi by 2, that is the wave is now travelling along the x direction then putting this value this quantity will become 0. So, you will end up give n

ω_2 equal to under root of $K_z n$ ω_1 equal to under root of K_y . And, again you will get these 2 polarisations which are the eigen-polarisation that is it is along the z direction, another is along the y direction. So, these are the two different polarisations.

(Refer Slide Time: 30:13)

we discussed.....

- ✓ Propagation of plane waves along z -direction
- ✓ Propagation of plane wave along the xz - plane
- ✓ Two polarisation directions

IIT KHARAGPUR | NPTEL ONLINE CERTIFICATION COURSES | Partha RoyChaudhuri
Physics

So, by doing this we could actually identify that what will be the direction of polarisation. What are the direction of the electric field vectors and a slightly different situation, when the wave is travelling along the xz plane what are the two different directions of the polarisations. So, in the next section we will continue with this.

Thank you.
