Lecture – 12
Wave propagation in anisotropic media

So, we have seen plane Waves in Anisotropic Medium and as very interesting to note that the electric field vectors experience two different refractive indices in an anisotropic medium; particularly in uniaxial medium we have seen that the ray velocity and the wave velocity they are different.

(Refer Slide Time: 00:41)

Under this heading we will be discussing today that this index ellipsoid, the general representation of ellipsoid which is the basis of understanding electromagnetic waves propagation in anisotropic medium. Then we will look at the ellipsoid matrix, we have seen the basic equation of ellipsoid while discussing this propagation in anisotropic medium.

Then we will see that how this ellipsoid can be rotated through Euler angle rotation to find out the principal axes system, this will give rise to the transformation matrix. Then there will be another way of doing this transformation by matrix diagonalisation then, because it is a matrix so we will end up with eigenvalues, eigenvectors.

And incidentally we will see that it is very interesting that the two methods of Euler angle rotation and matrix method will give you the same result in terms of the eigenvalues and the transformation matrix or the eigenvectors.

(Refer Slide Time: 02:03)

Ellipsoid matrix

In principal axes system: $\frac{x^2}{n_x^2} + \frac{y^2}{n_y^2} + \frac{z^2}{n_z^2} = 1$

In any coordinate system other than principal axes system the ellipsoid may look different:

$$\frac{x^2}{n_x^2} + \frac{y^2}{n_y^2} + \frac{z^2}{n_z^2} + \frac{2yz}{n_{yz}^2} + \frac{2zx}{n_{zx}^2} + \frac{2xy}{n_{xy}^2} = 1$$

Represents general equation of index ellipsoid

IIT KHARAGPUR | NPTEL ONLINE CERTIFICATION COURSES | Partha RoyChaudhuri
Physics

So, let us look at this index ellipsoid matrix; that is in general if you have an anisotropic medium which is characterized by the 3 refractive indices n_x , n_y and n_z ; we can write this index ellipsoid in this form. Note that this is if the principle axes system, because you have 3 you know crystallographic axes along which the refractive indices are characterized as n_x , n_y and n_z , but in any other coordinate system which is different from the crystallographic axes, crystallographic coordinate system.

Then this ellipsoid may look different, that is you will have cross terms yz , zx , xy and that is actually the general equation of an ellipsoid. And, will see that this ellipsoid is rotated from this ellipsoid when you consider with respect to the coordinate axes fixed with this system and fixed with any other system.

(Refer Slide Time: 03:17)

Ellipsoid other coordinate system

Anisotropic $n_x \neq n_y \neq n_z$

$$\frac{x^2}{n_x^2} + \frac{y^2}{n_y^2} + \frac{z^2}{n_z^2} + \frac{2yz}{n_{yz}^2} + \frac{2zx}{n_{zx}^2} + \frac{2xy}{n_{xy}^2} = 1$$

Ellipsoid principal axes system

rotation of axes

$$\frac{x^2}{n_x^2} + \frac{y^2}{n_y^2} + \frac{z^2}{n_z^2} = 1$$

IIT KHARAGPUR

Partha RoyChaudhuri
Physics

So, when we considered the general ellipsoid equation then it should look like this; you have an ellipsoid which is distorted, which is not distorted, which is having an inclination with the coordinate axes which is represented by the crystallographic axes that is the principle axes system.

So, in this system you can represent this x square by n x square plus y square by this so this is the ellipsoid equation and this is also the general equation for the ellipsoid and we considered that in general n x is not equal to n y is not equal to n z. Now, it simply suggest that this ellipsoid and this ellipsoid are the same, but it is rotated the axis is rotated or the ellipsoid is rotated with respect to the stationary axes system.

(Refer Slide Time: 04:22)

Identifying the ellipsoid

- ✓ In other axes system the ellipsoid is **rotated** from its principal axes
- ✓ **cross-terms** signify **rotations** of the ellipsoid about coordinate axes
- ✓ This ellipsoid rotation happens in **ELECTRO-OPTICS** and **ACCOUSTO-OPTICS**
- ✓ An **electric field** deforms the ellipsoid- in general with a **rotation** and/or **change in length of ellipsoid axes**
- ✓ changes in **squared terms** signify change in the **ellipsoid axes- no rotation**
- ✓ Similar situation occurs in presence of an **acoustic field**

IIT KHARAGPUR

NPTEL ONLINE
CERTIFICATION COURSES

Partha RoyChaudhuri
Physics

Now, how we identify the ellipsoid? In other axes system the ellipsoid is rotated from its principal axes system, that is what we have seen that you have an a you have a coordinate system which is called the principal axes system, but in any other coordinate system this ellipsoid will be rotated. That is if you rotate the coordinate system then you can again coincide, you can again make the coordinate system and the ellipsoid coincide. So, you can identify this from the cross terms that is yz zx and xy ; cross term signify rotations of the ellipsoid about the coordinate axis.

The ellipsoid rotation this kind of situation we will very often encounter in electro optics and acousto optics. And, this is the basis of analyzing this electro optic, effect acousto optic effect and also magneto optic effect that is under some field the ellipsoid will be distorted will be deformed and then you will have to will have to rotate or will have to give some transformation. So, that we get back the principle axis system and you can see that how the principle refractive indices are changed in the new coordinate system.

So, that is the basis and we will be mostly discussing our electro optics and acousto optics under the basis that is why this discussion is very useful and very important. An electric field deforms the ellipsoid in general with a rotation or and or change in the length of the ellipsoid axes, hope we will also consider this situation. Changes in the, and this will be obvious in a situation of isotropic medium in electro optic system where there will be only change in the length of the ellipsoid minor or major axes length of the ellipsoid.

So, changes in the squared term signify change in the ellipsoid axes, but in that case there is no rotation. Similar situation all this things may also happen in the case of the presence of acoustic field. So, there may be a distortion of the ellipsoid in presence of the acoustic field, in presence of the electro optic electric field or in presence of the magnetic field that also we will see later ok.

(Refer Slide Time: 06:55)

Ellipsoid under some field

Anisotropic $n_x \neq n_y \neq n_z$

$$\frac{x^2}{n_x^2} + \frac{y^2}{n_y^2} + \frac{z^2}{n_z^2} + px^2 + qy^2 + rz^2 = 1$$

Ellipsoid principal axes system

$$\frac{x^2}{n_x^2} + \frac{y^2}{n_y^2} + \frac{z^2}{n_z^2} = 1$$

change in length of axes

IIT KHARAGPUR
 NPTEL ONLINE CERTIFICATION COURSES
 Partha RoyChaudhuri
Physics

So, ellipsoid under some field; you can see that this is the ellipsoid under some field there has been only a change in the length when you compare this ellipsoid with this one, but the axes are the same the principal axes are all the same, but there has been a change in the length of the of the minor and major axes of the ellipsoid. That is you see p , x , square q , y , square and r square because, the new ellipsoid equation involves only the square terms, only the square term x square y square and z square as a result there is no rotation. But, if there are cross term that is x y y z x ; that means, there is a rotation so will understand this situation.

(Refer Slide Time: 07:47)

Means to transform

- ✓ To transform to principal axes system, one may apply **Euler angle rotations** to make the axes coincide with principal axes
- ✓ Alternatively, the ellipsoid matrix can be **diagonalised** to look for principal axes system

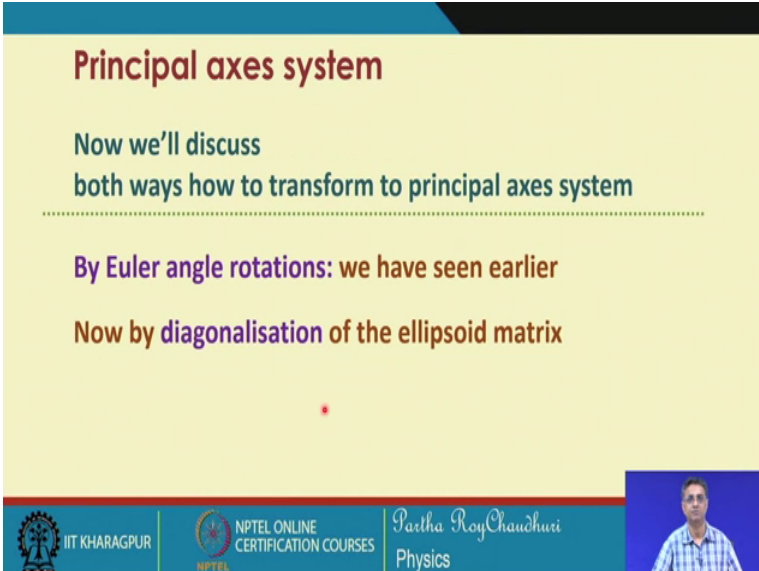

the 3 principal RI's: from the 3 eigenvalues
the new coordinates system: 3 eigenvectors

IIT KHARAGPUR
 NPTEL ONLINE CERTIFICATION COURSES
 Partha RoyChaudhuri
Physics

Now, the means to transform this ellipsoid to the principle axis system we will consider that there are cross terms that is we consider that the ellipsoid is changed under the action of some electric field or acoustic field or magnetic field we will understand this phenomenon. So, in that case one may apply this, Euler angle rotations to make the axes coincide with the principal axis, but alternatively one can do that matrix diagonalisation of the ellipsoid matrix to look for the principal axes system.

The 3 principle refractive indices will be the result and we the, we will get the 3 eigenvalues from the diagonalisation of the matrices. And we will also end up with 3 eigenvectors which will give you the transformation for the new coordinate system and we will see how it happens.

(Refer Slide Time: 08:48)

Principal axes system

Now we'll discuss
both ways how to transform to principal axes system

By Euler angle rotations: we have seen earlier

Now by diagonalisation of the ellipsoid matrix

IIT KHARAGPUR | NPTEL ONLINE CERTIFICATION COURSES | Partha RoyChaudhuri
Physics

The slide features a yellow background with a blue header and footer. The text is in various colors (red, blue, purple, brown) for emphasis. A small red dot is centered below the text. A video inset of the speaker is in the bottom right corner.

So, in both the ways we will taken example and will use both the both the methods to see; how the change coordinate, change ellipsoid can be made coincident with the principal axes system. So, first will consider you have already seen that Euler angle rotation, but will make a quick visit of this Euler angle rotation in order to make a comparison with the matrix diagonalisation process.

(Refer Slide Time: 09:12)

Example case

An ellipsoid for an **anisotropic (uniaxial) medium** under some field

$$\frac{x^2 + y^2}{n_o^2} + \frac{z^2}{n_e^2} + K \cdot 2xy = 1$$

The corresponding matrix:
$$\begin{pmatrix} \frac{1}{n_o^2} & K & 0 \\ K & \frac{1}{n_o^2} & 0 \\ 0 & 0 & \frac{1}{n_e^2} \end{pmatrix}$$

$K = \text{constant}$
 $n_o, n_e = \text{ordinary and extraordinary refractive indices respectively}$

IIT KHARAGPUR

NPTEL ONLINE
CERTIFICATION COURSES

Partha RoyChaudhuri
Physics

So, an ellipsoid for anisotropic medium uniaxial medium under some field will look like this. So, this may be equal to some electro optic coefficient multiplied by the electric field we will see that situation; which can be put as a constant K n_o and n_e they are the ordinary and extraordinary refractive indices and then we are very familiar with this ellipsoid which is for an uniaxial medium, but this is under the principle axis principle axis system that is the crystallographic axes system.

Now, corresponding to this equation we can write the ellipsoid matrix as 1 by n_o square 1 by n_o square by 1 by n_e . So, these are the diagonal elements of this the K matrix K elements will appear in this of diagonal positions.

(Refer Slide Time: 10:17)

Euler angle rotation

$$\frac{x^2 + y^2}{n_o^2} + \frac{z^2}{n_e^2} + K \cdot 2xy = 1$$

- ✓ One cross-term involving xy - tells a rotation about z
- ✓ Also x and y are symmetric - implies a rotation by 45°

IIT KHARAGPUR

NPTEL ONLINE
CERTIFICATION COURSES

Partha RoyChaudhuri

Physics

Now, this Euler angle rotation while applying this will have to do some inspection that because the cross term involves only x and y , therefore, it tells you that there should be rotation along z , because it is independent of z the cross terms are not involving any z . Then because it involves x and y which is you know symmetric if you change x by y or y by x the equation does not change; that means, it implies that the rotation will be by 45° degree and we have seen this in the earlier discussion also.

(Refer Slide Time: 10:51)

Coordinate transformation

A rotation of 45° about z -axis

$$z' = z$$

$$x' = x \cos 45^\circ + y \sin 45^\circ = \frac{x + y}{\sqrt{2}}$$

$$y' = -x \sin 45^\circ + y \cos 45^\circ = \frac{-x + y}{\sqrt{2}}$$

IIT KHARAGPUR

NPTEL ONLINE
CERTIFICATION COURSES

Partha RoyChaudhuri

Physics

So, a rotation about by 45° degree about the z axis will you will this transformation from this Euler angle rotation if you write that matrix so, z plane will be equal to z , x will be represented in terms of this 45° degree of x and 45° degree of y and similarly y prime will

be represent so, this is the transformed coordinate x dash y dash and z dash but, we need the reverse transformation.

(Refer Slide Time: 11:19)

Ellipsoid in new coordinates

Required reverse transformation: $x = \frac{x' - y'}{\sqrt{2}}$ $y = \frac{x' + y'}{\sqrt{2}}$

Ellipsoid in the new coordinates:

$$\frac{x'^2}{n_o^2} + x'^2 \cdot K + \frac{y'^2}{n_o^2} - y'^2 \cdot K + \frac{z^2}{n_e^2} = 1$$

$$* \left(\frac{1}{n_o^2} + K \right) x'^2 + \left(\frac{1}{n_o^2} - K \right) y'^2 + \frac{z^2}{n_e^2} = 1$$

The slide footer contains the IIT KHARAGPUR logo, NPTEL ONLINE CERTIFICATION COURSES logo, and the name Partha RoyChaudhuri, Physics. A small video inset of the speaker is visible in the bottom right corner.

So, knowing this if you put the values of this from these two equation x dash to x plus y y dash to minus x plus y and z to z dash we can actually write the reverse transformation in this form. So, the ellipsoid in the new coordinate system will look like this because in place of x if I substitute this value of this so, square of this will appear square of this will appear in place of these equation x square plus y square by n o square z will remain z prime as it is so we will have a change in only the x square and y square. So, that is what we have trying to write.

(Refer Slide Time: 11:53)

Euler angle rotation

$$\frac{x^2 + y^2}{n_o^2} + \frac{z^2}{n_e^2} + K \cdot 2xy = 1$$

- ✓ One cross-term involving xy - tells a rotation about z
- ✓ Also x and y are symmetric - implies a rotation by 45°

NPTEL ONLINE
CERTIFICATION COURSES

NPTEL

Partha RoyChaudhuri
Physics

So, effectively we can write this because you have $1/n_o^2 + 1/n_o^2 + K$ so we put two of them in one bracket. So, this is the new coefficient which is attached to x dash square and this should be equivalent to $1/n_x^2$ and this should be equivalent to, this should be equal to $1/n_y^2$ and z this n_e remains as it is. So, we started with a medium which was which was uniaxial because x and y refractive indices were same, but now we get the refractive indices which are all of them are different for x , y and z .

(Refer Slide Time: 13:07)

Principal Refractive indices

new ellipsoid equation $\frac{x'^2}{n_x^2} + \frac{y'^2}{n_y^2} + \frac{z'^2}{n_z^2} = 1$

where $\frac{1}{n_x^2} = \left(\frac{1}{n_o^2} + K\right)$ $\frac{1}{n_y^2} = \left(\frac{1}{n_o^2} - K\right)$ $\frac{1}{n_z^2} = \frac{1}{n_e^2}$

Since $n_x \neq n_y \neq n_z$ the medium is
now a **biaxial one** under the field *

NPTEL ONLINE
CERTIFICATION COURSES

NPTEL

Partha RoyChaudhuri
Physics

So, that represents a biaxial system so the new ellipsoid in this case we can write as we can write as n_x^2 dash square by x prime square plus n_y^2 dash square by y prime square plus n_z^2 dash square by z prime square equals 1.

z' prime square by $n z$ square equal to so this is again the known form of the ellipsoid, so; that means, under Euler angle rotation we have been able to bring the ellipsoid back into the principle axes system and we have used that $n x$ square is equal to 1 upon n square plus K and similarly $n y$ square equal to.

So, let us remember that $n x$ dash the new principle, new effect $n x$ representation for the principle axis system is equal to this and $n y$ for the new principal axes system will be equal to this and $n z$ equal to this. So, these are the 3 values of this $n x$ $n y$ and $n z$ we will see the same result when will apply this diagonalisation method.

(Refer Slide Time: 14:24)

Ellipsoid in new coordinates

the transformation: $x' = x \cos 45^\circ + y \sin 45^\circ = \frac{x+y}{\sqrt{2}}$
 $y' = -x \cos 45^\circ + y \sin 45^\circ = \frac{-x+y}{\sqrt{2}}$
 $z' = z$

Connection matrix: $\begin{pmatrix} x' \\ y' \\ z' \end{pmatrix} = \begin{pmatrix} \frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} & 0 \\ -\frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} x \\ y \\ z \end{pmatrix}$

IIT KHARAGPUR | NPTEL ONLINE CERTIFICATION COURSES | Partha RoyChaudhuri | Physics

Also remember that this transformation which we imposed that is x dash equal to this, y dash equal to this, which is corresponding to this matrix this will correspond to this matrix, because this will give you 1 by root 2 this will be 1 by root 2 this will be minus 1 by root 2 and z for this will become will be equal to 0. So, this is the transformation matrix from x dash y dash z dash to from $x y z$ to x dash y dash z dash, but we need the reverse transformation: that is we have to express this $x y z$ in terms of x prime, y prime and z prime.

(Refer Slide Time: 15:09)

Ellipsoid in new coordinates

reverse transformation:

$$x = \frac{x' - y'}{\sqrt{2}}$$

$$y = \frac{x' + y'}{\sqrt{2}}$$

$$z = z'$$

Transformation matrix:

$$\begin{pmatrix} x \\ y \\ z \end{pmatrix} = \begin{pmatrix} \frac{1}{\sqrt{2}} & -\frac{1}{\sqrt{2}} & 0 \\ \frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} & 0 \\ 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} x' \\ y' \\ z' \end{pmatrix}$$

Partha RoyChaudhuri
Physics

So, then the matrix will look like this x y z will become 1 by root 2 minus 1 because in that case will use this relation so these are the transformation matrix from x-x dash frame whereas, this is the transformation matrix which is from x dash frame to x frame. But, we have used this so, this equation will remember and we will compare with the result that we have obtained from the method of diagonalisation ok.

(Refer Slide Time: 15:44)

Diagonalisation

Now we'll use matrix diagonalisation:

- ✓ this will yield 3 principal RI's as eigen values
- ✓ and 3 eigenvectors to devise new coordinates system
- ✓ which are the principal axes system

Partha RoyChaudhuri
Physics

Now, we will use this matrix diagonalisation this will yield 3 principle refractive indices as eigenvalues these 3 eigenvectors will be used to device the new coordinate system: which will correspond to the transformation and this will give you the new principal axis system.

(Refer Slide Time: 16:04)

Ellipsoid equation

We started with the ellipsoid equation

$$\frac{x^2}{n_o^2} + \frac{y^2}{n_e^2} + K \cdot 2xy = 1$$

The corresponding matrix: $\begin{pmatrix} \frac{1}{n_o^2} & K & 0 \\ K & \frac{1}{n_o^2} & 0 \\ 0 & 0 & \frac{1}{n_e^2} \end{pmatrix}$

IIT KHARAGPUR

NPTEL ONLINE CERTIFICATION COURSES

Partha RoyChaudhuri
Physics

So, this is the mathematical operation that will perform with this ellipsoid matrix index ellipsoid matrix.

(Refer Slide Time: 16:13)

$$\begin{pmatrix} \frac{1}{n_o^2} & K & 0 \\ K & \frac{1}{n_o^2} & 0 \\ 0 & 0 & \frac{1}{n_e^2} \end{pmatrix} = \begin{pmatrix} a & K & 0 \\ K & a & 0 \\ 0 & 0 & b \end{pmatrix} = A$$

Eigenvalues equation yields: $\det|A-\lambda I| = 0$

$$\det \begin{vmatrix} a-\lambda & K & 0 \\ K & a-\lambda & 0 \\ 0 & 0 & b-\lambda \end{vmatrix} = 0$$

$$(a-\lambda)(a-\lambda)(b-\lambda) - K^2(b-\lambda) = 0$$

IIT KHARAGPUR

NPTEL ONLINE CERTIFICATION COURSES

Partha RoyChaudhuri
Physics

So, this matrix we just write for 1 by n o square equal to a 1 by n o square equal to a and 1 by n e square equal to b. Therefore, this matrix equation for diagonalisation we have to write this eigenvalue equation which is equal to determinant of this matrix a minus lambda I equal to which is the eigenvalue matrix is equal to 0. Which is again very well known in the basic mathematics of matrix diagonalisation and by doing so, we write this

determinant of this equal to 0 because a minus lambda, a minus lambda, b minus lambda this determinant will be equal to 0. If you open up the bracket will get this a minus lambda a minus lambda b minus lambda and K square b minus lambda equal to 0 just from here K this into this ok.

(Refer Slide Time: 17:19)

Eigenvalues: Principal RI's

$$(a - \lambda)(a - \lambda)(b - \lambda) - K^2(b - \lambda) = 0$$

$$(b - \lambda)\{(a - \lambda)^2 - K^2\} = 0$$

So the **eigenvalues** are:

$$\lambda = a + K$$

$$\lambda = a - K$$

$$\lambda = b$$

$a = \frac{1}{n_o^2}$ and $b = \frac{1}{n_e^2}$

So the **principal RI's** are:

$$\frac{1}{n_x^2} = \left(\frac{1}{n_o^2} + K\right)$$

$$\frac{1}{n_y^2} = \left(\frac{1}{n_o^2} - K\right)$$

$$\frac{1}{n_z^2} = \frac{1}{n_e^2}$$

IIT KHARAGPUR | NPTEL ONLINE CERTIFICATION COURSES | Partha RoyChaudhuri | Physics

So, from this equation if you take b minus lambda bracketed out then you will have a minus lambda square minus K square equal to 0 this gives you two possibilities that this bracket may correspond to equal to 0 or this bracket b minus lambda may correspond to equal to 0. So, the eigenvalues are corresponding to this bracket will be equal to a plus K lambda and the other value will be a minus K which is obvious from here a minus lambda equal to plus minus K. So, a these are the two roots of the that coming that results from the 1st bracket and lambda equal to b it comes from this bracket b equal to lambda.

Therefore, we get the eigenvalues because lambda equal to a lambda because we have substituted a equal to 1 by n o square and b equal to 1 by n e square if we get it back then you can write this the eigenvalues lambda equal to 1 by n o square plus K this will be 1 by n o square minus K, which are exactly the same that we obtained from the Euler angle rotation. So, this is your new n x square 1 upon n x square and this is 1 upon 1 n y square which is the new principle refractive indices this 1 by n z square n e square that remains the same.

(Refer Slide Time: 19:03)

Eigenvectors: new axes

Recall the **eigenvalue equation**: $AX = \lambda X$

Eigenvector corresponding to: $\lambda = a + K$

$$\begin{pmatrix} a & K & 0 \\ K & a & 0 \\ 0 & 0 & b \end{pmatrix} \begin{pmatrix} x \\ y \\ z \end{pmatrix} = (a + K) \begin{pmatrix} x \\ y \\ z \end{pmatrix}$$

$$\begin{aligned} ax + Ky &= ax + Kx &\Rightarrow x &= y \\ Kx + ay &= ay + Ky &\Rightarrow x &= y \\ bz &= (a + K)z &\Rightarrow z &= 0 \end{aligned}$$

$$X = \begin{pmatrix} x \\ y \\ z \end{pmatrix} = c \begin{pmatrix} 1 \\ 1 \\ 0 \end{pmatrix} = \frac{1}{\sqrt{2}} \begin{pmatrix} 1 \\ 1 \\ 0 \end{pmatrix}$$

since $x^2 + y^2 + z^2 = 1$

Now, will have to look for the eigenvectors recall that eigenvalue equation $A X$ equal to λX and the eigenvector corresponding to this λ is $a + K$, which is the first eigenvector we have called $a + K$, if I use this eigenvector then we can write this equation this equation as x equal to the eigenvector eigenvalue $a + K$ x .

(Refer Slide Time: 19:17)

Eigenvalues: Principal RI's

$$(a - \lambda)(a - \lambda)(b - \lambda) - K^2(b - \lambda) = 0$$

$$(b - \lambda)\{(a - \lambda)^2 - K^2\} = 0$$

So the **eigenvalues** are:

$$\begin{aligned} \lambda &= a + K \\ \lambda &= a - K \\ \lambda &= b \end{aligned}$$

$$a = \frac{1}{n_o^2} \text{ and } b = \frac{1}{n_e^2}$$

So the **principal RI's** are:

$$\frac{1}{n_x^2} = \left(\frac{1}{n_o^2} + K\right) \quad \frac{1}{n_y^2} = \left(\frac{1}{n_o^2} - K\right) \quad \frac{1}{n_z^2} = \frac{1}{n_e^2}$$

So, if I just take the 3 simultaneous equation obtained from this matrix equation $a x$ plus $K y$ equal to $a x$ plus $K x$ this simply says that if you removed a x from either side then you will end up with $K y$ equal to $K x$; that means, x must be equal to y , so, that is what

is implied by writing x equal to y. From the 2nd equation a y and a y will cancel from either side, which will give you K x equal to K y and that yields the same equation that is the same relation that is x is equal y, but from the 3rd equation b z equal to a plus K into z.

So, it tells you that because a plus K cannot be equal to b so therefore, b z must be equal to 0, therefore, you get the eigenvector x equal to x y and z because x equal to y so putting x equal to x equal to y equal to c we can write that 1 1 0 c if you take outside, now, since x square plus, y square plus, z square equal to 1 then you can write this normalized eigenvector 1 by root 2 1 1 0.

(Refer Slide Time: 21:09)

2nd solution: eigenvector

Eigenvector corresponding to: $\lambda = a - K$

$$\begin{pmatrix} a & K & 0 \\ K & a & 0 \\ 0 & 0 & b \end{pmatrix} \begin{pmatrix} x \\ y \\ z \end{pmatrix} = (a - K) \begin{pmatrix} x \\ y \\ z \end{pmatrix}$$

$$\begin{aligned} ax + Ky &= ax - Kx \Rightarrow -x = y & \text{If } y = c, x = -c \\ Kx + ay &= ay - Ky \Rightarrow x = -y \\ bz &= (a - K)z \Rightarrow z = 0 \end{aligned}$$

$$X = c \begin{pmatrix} -1 \\ 1 \\ 0 \end{pmatrix} = \frac{1}{\sqrt{2}} \begin{pmatrix} -1 \\ 1 \\ 0 \end{pmatrix}$$

IIT KHARAGPUR | NPTEL ONLINE CERTIFICATION COURSES | Partha RoyChaudhuri
Physics 22

And in the same way we will considered the 2nd eigenvalue that is lambda equal to a minus K we will substitute in the eigenvalue equation a a b x y z the eigenvalue and again the eigenvector. Therefore, the we again get the 3 equations simultaneous equations and these are a x plus K y equal to you can remove a x from either side that tells you that K y equal to minus K x which is very straight forward that minus x equal to y and from the 2nd equation if you removed a y you get K x equal to minus K y that also gives you the same relation that is K x equal to minus y.

Now, if y equal to c the next will become equal to minus c and if you put it back or the 3rd one also gives you that z is equal to 0. In the same way we found in the 1st

eigenvalue case that is b and a minus K they are unlikely to be equal in that case z must be equal to 0 so we get this eigenvector corresponding to the eigenvalue a minus K .

(Refer Slide Time: 22:31)

3rd solution: eigenvector

Eigenvector corresponding to: $\lambda = b$

$$\begin{pmatrix} a & K & 0 \\ K & a & 0 \\ 0 & 0 & b \end{pmatrix} \begin{pmatrix} x \\ y \\ z \end{pmatrix} = b \begin{pmatrix} x \\ y \\ z \end{pmatrix}$$

$$\left. \begin{aligned} ax + Ky = bx &\Rightarrow y = \frac{b-a}{K}x \\ Kx + ay = by &\Rightarrow x = \frac{b-a}{K}y \end{aligned} \right\} \begin{aligned} \frac{b-a}{K} &= \frac{K}{b-a} \Rightarrow (b-a)^2 = K^2 \\ &\Rightarrow b = a + K \text{ or } b = a - K \\ &\Rightarrow \text{eigenvalues must be distinct} \end{aligned}$$

$$bz = bz \Rightarrow z = a \text{ free choice} \Rightarrow \text{Not a solution: } x = 0 = y$$

IIT KHARAGPUR | NPTEL ONLINE CERTIFICATION COURSES | Partha RoyChaudhuri Physics

Let us now see the 3rd eigenvalue that is corresponding to $\lambda = b$, we have this eigenvalue equation in this case this is the eigenvalue and this is the eigenvector the 3 simultaneous equations are this. So, from the 1st equation $ax + Ky = bx$ what does it mean? It means that $y = \frac{b-a}{K}x$, from the 2nd equation we get $Kx + ay = by$ this means $x = \frac{b-a}{K}y$, which are very difficult I mean which will give you this equation $b - K = K / (b - a)$ so that gives you $(b - a)^2 = K^2$.

Therefore, you will have which is indeed very difficult to give one unique value of x and y b will be equal to $a + K$ or b is equal to $a - K$ so both the possibilities the connection with a and b are including both the values $a + K$ or $a - K$. But, eigenvalues must be distinct and they should not merge they should be separate, so as a result this x this cannot give you any solution. So therefore, $x = 0$ and y is also equal to 0 and z will have a free choice, because on either side $bz = bz$ so; that means, you can take z can assume any value so you have a free choice of z .

3rd solution: eigenvector

Eigenvector corresponding to: $\lambda = b$

therefore $x = 0 = y$
and let $z = c$ } $X = c \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix}$

If I use this relation that x equal to 0 y equal to 0 and z equal to c then we can write that eigenvector x equal to c 0 0 1 and under normalization we can write this equation like 0 0 1.

(Refer Slide Time: 24:29)

Transformation matrix

So we have the eigenvectors

$\frac{1}{\sqrt{2}} \begin{pmatrix} 1 \\ 1 \\ 0 \end{pmatrix}$ $\frac{1}{\sqrt{2}} \begin{pmatrix} -1 \\ 1 \\ 0 \end{pmatrix}$ and $\begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix}$

Combining these eigenvectors

SAME transformation matrix

$$\begin{pmatrix} \frac{1}{\sqrt{2}} & -\frac{1}{\sqrt{2}} & 0 \\ \frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} & 0 \\ 0 & 0 & 1 \end{pmatrix}$$

Now, we have 3 eigenvalues and 3 eigenvectors then if I combine this 3 eigenvectors then we can write this equation this matrix as $\frac{1}{\sqrt{2}}$ $-\frac{1}{\sqrt{2}}$ 0 you can see this from here $\frac{1}{\sqrt{2}}$ $\frac{1}{\sqrt{2}}$ 0 here $\frac{1}{\sqrt{2}}$ $-\frac{1}{\sqrt{2}}$ $\frac{1}{\sqrt{2}}$ $\frac{1}{\sqrt{2}}$ 0 and this will be 0 0 1. So, I just put combine all 3 eigenvectors together which is nothing, but the transformation matrix that we obtained from the Euler angle rotation.

So, we have discussed in this context that a general index ellipsoid which is very useful in analyzing the waves electromagnetic waves in anisotropic medium and how this ellipsoid will look in general coordinate system which is different from the principle axes system. This ellipsoid will associate itself with a, with an ellipsoid matrix. So, there are beings of bringing the ellipsoid which is otherwise not looking very simple to bring it back to the principle axes system. There are methods one is this Euler angle rotation, that if I can give the proper rotation to the coordinate axes then, we can make the coordinate axes coincide with the principle axes system; that is the one which are associate with the crystallographic axes.

The other method is to use this matrix transformation and by diagonalising the matrices we can and again get the eigenvalues and eigenvectors. We have seen that by using Euler angle rotation, we get the principal refractive indices and we also find the transformation matrix by matrix diagonalisation. We also till date have found that the 3 principle refractive indices which are the same as we obtained from here and these 3 eigenvectors were combined together to get the transformation matrix.

So, this discussion is very useful and we will be very often on using in the analysis of electro optic effect, the modulators, switching of the modulators by considering just diagonalisation or this Euler angle inspection for evaluating the electro optic, magneto optic and accousto optic effects.

Thank you very much.
