$$e^- + \gamma \rightarrow e^- + \gamma$$

$$d\sigma = \frac{\alpha^2}{2} \sum_r \sum_s \left| \frac{M}{-i\epsilon} \right|^2 \left( \frac{k'}{k} \right)^2 d\Omega$$

$$\frac{M}{-i\epsilon} = \bar{u}_r(p') \left( \not{\epsilon}' \frac{1}{\not{p} + \not{k} - m} \not{\epsilon} + \not{\epsilon} \frac{1}{\not{p} - \not{k}' - m} \not{\epsilon}' \right) u_s(p)$$

$$= \bar{u}_r(p') O u_s(p)$$

$$X = \sum_{r,s} |\bar{u}_r(p') O u_s(p)|^2 = \text{Tr} \left( O \frac{\not{p} + m}{2m} \bar{O} \frac{\not{p}' + m}{2m} \right) \quad \bar{O} = \gamma^0 O^\dagger \gamma^0$$

$$= \text{tr} \left( \left( \frac{\not{\epsilon}' \not{p} \not{\epsilon}}{2p \cdot k} + \frac{\not{\epsilon} \not{p}' \not{\epsilon}'}{2p \cdot k'} \right) \left( \frac{\not{p} + m}{2m} \right) \left( \frac{\not{p} \not{\epsilon} \not{\epsilon}'}{2p \cdot k} + \frac{\not{p}' \not{\epsilon}' \not{\epsilon}}{2p \cdot k'} \right) \left( \frac{\not{p}' + m}{2m} \right) \right)$$

So, let me summarize our discussion so far. We have been computing the cross section for a Compton's scattering. So, e minus plus gamma going to e minus plus gamma and then, we have seen that the differential scattering cross section the sigma is given by alpha square over 2 sum over r s mode m over minus i e square whole square k 0 prime k 0 square d omega, where this quantity here m over minus i e square. We have seen this given by u bar r p prime epsilon prime slash 1 over p slash plus k slash minus m epsilon slash plus epsilon slash 1 over p slash minus k prime slash minus n epsilon prime slash u s p which is of this for u bar r p, prime time's some operator u s p. What we are interested is mode square of this sum d over r s.

So, I will denote this quantity x to be sum over r s mode u bar r p prime o u sp square and what we have seen is that this quantity is nothing, but given by trace o p slash plus m over 2 m o bar p prime slash plus m divided by 2 m where o is given by this quantity here. So, when I substitute this for o and our o bar is gamma 0 overtake a gamma 0.

When we substitute for  $\epsilon$  what we get, this quantity is nothing, but some of photons. So, let me do one more step this is trace of  $\epsilon_{\mu\nu} k_{\nu} \epsilon_{\mu\lambda} p_{\lambda} + m$  over  $2m k_{\nu} \epsilon_{\nu\mu} \epsilon_{\nu\lambda} p_{\lambda}$  over  $2m k_{\nu} k_{\nu} + k_{\nu} p_{\nu}$  over  $2m$ .

(Refer Slide Time: 04:18)

$$X = \frac{1}{16k^2(p.k)^2} T_1 + \frac{1}{16k^2(p.k)(p.k')} (T_2 + T_3) + \frac{1}{16(p.k.p.k')} T_4$$

$$T_1 = \text{tr}(\not{\epsilon}' \not{k} (\not{p} + m) \not{\epsilon} \not{p}) \leftarrow \begin{matrix} \epsilon \leftrightarrow \epsilon' \\ k \leftrightarrow -k' \end{matrix}$$

$$= 8(p.k) [2(\epsilon'.k)^2 + p.k']$$

$$T_4 = \text{tr}(\not{\epsilon} \not{k}' (\not{p} + m) \not{\epsilon}' \not{p})$$

$$= -8(p.k') [2(\epsilon.k)^2 - p.k]$$

$$T_2 \xleftrightarrow{\begin{matrix} \epsilon \leftrightarrow \epsilon' \\ k \leftrightarrow -k' \end{matrix}} T_3$$

So, this is the quantity I have expressed it in terms of  $T_1, T_2, T_3$  for  $X$  is equal to if I expand this will get four terms. So, I have denoted them as  $\frac{1}{16m^2 p \cdot k} T_1 + \frac{1}{16m^2 p \cdot k p \cdot k'} T_2 + \frac{1}{16m^2 p \cdot k p \cdot k'} T_3 + \frac{1}{16(p \cdot k p \cdot k')} T_4$ . We have evaluated  $T_1$  and then we have shown that  $T_1$  is equal to trace of  $\epsilon_{\mu\nu} k_{\nu} \epsilon_{\mu\lambda} p_{\lambda} + m$  over  $2m k_{\nu} \epsilon_{\nu\mu} \epsilon_{\nu\lambda} p_{\lambda}$  over  $2m k_{\nu} k_{\nu} + k_{\nu} p_{\nu}$  over  $2m$ . We are going to evaluate  $T_2, T_3$  and  $T_4$ , but you can notice that, if you just look at the expression  $T_4$  then this is given by first and last term.

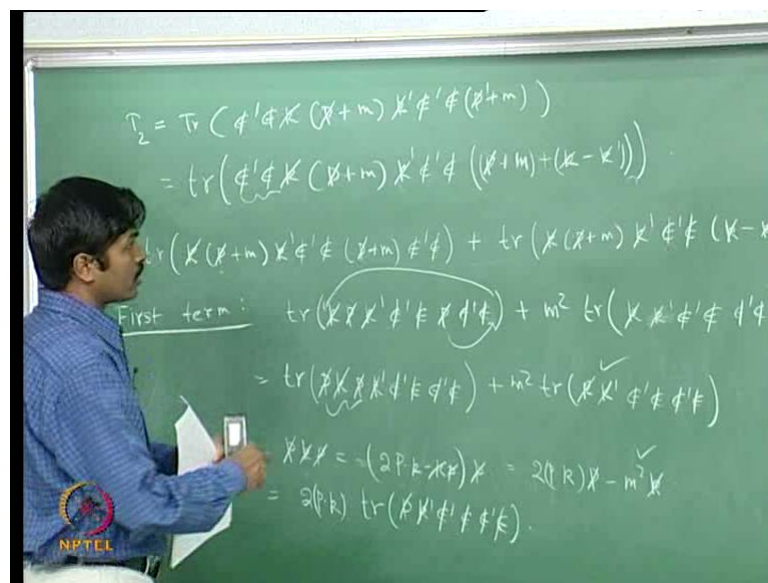

So, these are the last two terms multiplied and between these two  $\epsilon_{\mu\nu} k_{\nu} \epsilon_{\mu\lambda} p_{\lambda} + m$  over  $2m k_{\nu} \epsilon_{\nu\mu} \epsilon_{\nu\lambda} p_{\lambda}$  over  $2m k_{\nu} k_{\nu} + k_{\nu} p_{\nu}$  over  $2m$ . Now, you can notice one interesting fact. These  $T_1$  and  $T_4$  are related to each other by this efficiency  $\epsilon$  to  $\epsilon'$  and if you access  $k$  2

minus  $k'$  then this term and this term at the same. So, you do not need to evaluate this  $t$  for explicitly. All you have to do is to do substitution in  $p$  one, then you will get what you want for  $T_4$ .

So, this immediately tells us what  $T_4$  is. It is simply  $8 p \cdot k'$  with a minus sign and then twice  $\epsilon \cdot k'$ , where plus minus  $\epsilon \cdot 0$ . So,  $\epsilon$  goes to  $\epsilon$   $k$  goes to minus  $k'$ , but there is a whole square. So, this is twice  $\epsilon \cdot 0 k'$  and here  $k'$  goes to minus  $k$ . Therefore, I got a minus sign. There is an overall minus sign because of the presence of  $p \cdot 0 k$ . So, immediately I evaluated  $T_4$ . Similarly, you can see that  $T_2$  and  $T_3$  are also related by the same symmetry. If you consider exchange of the photon polarization and the momentum with a minus sign  $k$  goes to minus  $k'$  then  $T_2$  is related to  $T_3$ .

So, it is enough for us to compute  $T_2$ , which is given by  $T_2 = \text{trace } \epsilon \cdot k \cdot \epsilon \cdot p + m \cdot k \cdot \epsilon \cdot p$ . So,  $T_2$  is the product of this and  $T_3$  is the product of this. So, these are  $T_2$ s and  $T_3$ s and you can see clearly that  $T_2$  and  $T_3$  are related by this symmetry that I have given here. So, I will work out from this trace of detail and then from  $T_2$ , we will get the expression for  $T_3$  also. Finally, we will put all this values for  $T_1 T_2 T_3 T_4$  in this expression and we will put  $x$  in the expression for the differential scattering cross section, finally we will get a differential scattering cross section.

(Refer Slide Time: 10:19)

So, let us try to do this trace, you start with these and then you note that  $p$  prime plus  $k$  prime is equal to  $p$  plus  $k$ , the large moment of conservation rule. So,  $p$  prime is the  $p$  prime  $k$  minus  $k$  prime, which I will substitute here.

So, when I do that, I get trace  $\epsilon$  prime slash  $\epsilon$  slash  $k$  slash  $p$  slash plus  $m$  and a  $k$  prime slash  $\epsilon$  prime slash  $\epsilon$  slash. This quantity is just  $p$  slash plus  $m$  plus  $k$  minus  $k$  prime slash. Alright! So, the trace of these things I will take this and use this cyclic property of trace and then I will bring this fact here and then I will split into two terms, in one I will step plus 1  $m$ , the other I will have  $k$  slash minus  $k$  prime slash. Let us do that.

So, when I do that, I get trace of  $k$  slash  $p$  slash plus  $m$   $k$  prime slash  $\epsilon$  prime slash  $\epsilon$  slash and then  $p$  slash plus  $m$   $\epsilon$  prime slash  $\epsilon$  slash that is the first term and the second term is a trace of  $k$  slash  $p$  slash plus  $m$   $k$  prime slash  $\epsilon$  prime slash  $\epsilon$  slash then  $k$  slash minus  $k$  prime slash  $\epsilon$  prime slash  $\epsilon$  slash that the second term we will evaluate each of these term. So, let us consider the first term first. So, the first term again you can see in general, if you expand this you will get four terms, one which does not contain  $m$  at all, the other one contains  $m$  square and there are two more terms which are linear in  $m$ , but term which are linear in  $m$  contains all number of gamma matrices you can count as 1 2 3 4 5 6 7 8.

So, they contain even one piece. So, they contain seven gamma matrices trace is 0, so the first term is simply trace of  $k$  slash  $p$  slash  $k$  prime slash  $\epsilon$  prime slash  $\epsilon$  slash  $p$  slash  $\epsilon$  prime slash  $\epsilon$  slash. This is the first term and then the second one contains  $m$  square trace  $k$  slash  $k$  prime slash  $\epsilon$  prime slash  $\epsilon$  slash  $k$  prime slash  $\epsilon$  prime slash  $\epsilon$  slash and again  $\epsilon$  prime slash  $\epsilon$  slash. Now, what we can do is you can bring this  $p$  slash to this  $n$  here, because  $p$  dot  $\epsilon$  equal top 0  $\epsilon$  prime equal to 0 this implies  $p$  slash  $\epsilon$  prime slash is minus  $\epsilon$  prime slash  $p$  slash. So, if you move it once you will get 1 minus  $\sin$  similarly again  $p$  slash  $\epsilon$  slash is minus  $\epsilon$  slash  $p$  slash.

So, you will get 2 minus  $\sin$  which is plus 1, therefore what you can do is just pull this  $p$  slash to here and then you use the cyclic property of trace and then, finally this  $p$  slash you can write it here, so this becomes trace of  $p$  slash  $k$  slash  $p$  slash  $k$  prime slash  $\epsilon$  prime slash  $\epsilon$  slash  $\epsilon$  prime slash  $\epsilon$  slash, this is the first term

and the second term is  $m$  square trace of  $k$  slash  $k$  prime slash  $\epsilon$  prime slash  $\epsilon$  slash prime slash  $\epsilon$  slash prime slash  $\epsilon$  slash, but now you notice this term here. This three terms, the first three term this  $p$  slash  $k$  slash  $p$  slash which is given by  $p$  slash  $k$  slash is plus price  $p$   $0$   $k$  minus  $k$  slash  $p$  slash right this times  $p$  slash, therefore the first term you get is twice  $p$   $0$   $k$   $p$  slash and in the second term you have  $2$   $p$  slash. What is  $p$  slash square? It is simply  $p$  square which is equal to  $m$  square. So, this is minus  $m$  square  $k$  slash, now in the second term if you just see minus  $m$  square  $k$  slash here, this will exactly cancel with this term here. So, this term here cancels this and hence this is simply given by twice  $p$   $0$   $k$  times trace of  $p$  slash  $k$  prime slash  $\epsilon$  prime slash  $\epsilon$  slash prime slash  $\epsilon$  slash. So, the whole things now reduce to some trace which involves  $6$  gamma matrices. We can further simplify it and then we can write it in terms of the product of all this piece case and  $\epsilon$ .

(Refer Slide Time: 18:35)

So, let us do that. So, we are evaluating the first term and we have seen that this reduce to twice  $p$   $0$   $k$  trace of  $p$  slash  $p$  prime slash  $\epsilon$  prime slash  $\epsilon$  slash prime slash  $\epsilon$  slash. Now, I can again do is let us say the simplest thing, but I can bring it here and then I will use the fact that  $p$  dot  $\epsilon$  equal to  $0$ , then if I pull it here it will get four times minus  $1$  which is  $I$  plus  $1$ . So, this quantity itself is equal to twice  $p$   $0$   $k$  trace of  $k$  prime slash  $p$  slash  $\epsilon$  prime slash  $\epsilon$  slash prime slash  $\epsilon$  slash. So, this quantity itself is equal to twice  $p$   $0$   $k$  trace of  $k$  prime slash  $p$  slash  $\epsilon$  prime slash  $\epsilon$  slash prime slash  $\epsilon$  slash. So, the whole things now reduce to some trace which involves  $6$  gamma matrices. We can further simplify it and then we can write it in terms of the product of all this piece case and  $\epsilon$ .

So, I take this  $p$  slash here and then I use this property  $p$  slash  $\epsilon$  slash  $p$  slash is minus  $p$  slash  $\epsilon$  slash and  $\epsilon$  prime slash  $p$  slash equal to minus  $p$  slash  $\epsilon$  prime slash. So, I use this twice, and then I get this identity. Now, what I can do is take this quantity twice  $p$  0  $k$  times half of some of these two terms half of trace  $\epsilon$  slash  $k$  prime slash plus  $k$  prime slash  $p$  slash times  $\epsilon$  prime slash  $\epsilon$  slash  $\epsilon$  prime slash  $\epsilon$  slash, now what is this quantity  $a$  slash  $b$  slash plus  $b$  slash  $a$  slash? It is simply twice  $a$  0  $b$  because this will give  $\gamma$   $\mu$   $\gamma$   $\mu$   $\gamma$   $\mu$   $\gamma$   $\mu$  which is twice  $\eta$   $\mu$   $\nu$  times  $a$   $\mu$   $n$   $\mu$  which is twice  $a$  0  $b$ . So, what I get is twice  $p$  0  $k$  times half times 2 will give me one  $p$  d0 ot  $k$  prime trace of  $\epsilon$  prime slash  $\epsilon$  prime plus  $\epsilon$  prime slash. Now, I need to evaluate the trace of this, but anything which contains 4  $\gamma$  matrices, it is very easy to evaluate the trace. So, now I will trace  $\gamma$   $\mu$   $\gamma$   $\mu$   $\gamma$   $\rho$   $\gamma$   $\sigma$  is equal to 4  $\eta$   $\mu$   $\eta$   $\rho$   $\sigma$  minus 4  $\eta$   $\mu$   $\rho$   $\eta$   $\mu$   $\sigma$  is equal to 4  $\eta$   $\mu$   $\nu$   $\eta$   $\rho$   $\sigma$  minus 4  $\eta$   $\mu$   $\rho$   $\eta$   $\nu$   $\sigma$  plus 4  $\eta$   $\mu$   $\sigma$   $\eta$   $\mu$   $\rho$ . So, then it is very easy to use this relation to evaluate this trace. So, let us now prove that the trace of  $\gamma$  4 matrices is equal to this and then we will use this relation to evaluate this trace. It is very easy to prove that you just have to pull this  $\gamma$   $\sigma$  here three times and then use cyclic property of trace.

So, let us see that trace of  $\gamma$   $\mu$   $\gamma$   $\nu$   $\gamma$   $\rho$   $\gamma$   $\sigma$  is equal to trace  $\gamma$   $\mu$   $\gamma$   $\nu$  times twice  $\eta$   $\rho$   $\sigma$  minus  $\gamma$   $\sigma$   $\gamma$   $\rho$  alright. So, this is twice  $\eta$   $\rho$   $\sigma$  trace  $\gamma$   $\mu$   $\gamma$   $\nu$  and then minus trace of  $\gamma$   $\mu$   $\gamma$   $\nu$   $\gamma$   $\sigma$   $\gamma$   $\rho$ . Again I will pull this  $\gamma$   $\sigma$  here, then I will get this to be twice  $\eta$  by the trace of  $\gamma$   $\mu$   $\gamma$   $\nu$  is four times  $\eta$   $\mu$   $\nu$ .

(Refer Slide Time: 24:21)

$$AB + BA = 2A \cdot B$$

$$\eta^{\mu\sigma} \eta^{\nu\rho}$$

$$\text{tr}(\rho\sigma) = 8\eta^{\mu\nu}\eta^{\rho\sigma} - 8\eta^{\mu\rho}\eta^{\nu\sigma} + \text{tr}(\rho^{\mu\nu}\sigma^{\rho\sigma})$$

$$= 8\eta^{\mu\nu}\eta^{\rho\sigma} - 8\eta^{\mu\rho}\eta^{\nu\sigma} + 8\eta^{\mu\sigma}\eta^{\nu\rho} - \text{tr}(\rho^{\mu\nu}\sigma^{\rho\sigma})$$

So, what I get is 8 eta mu nu eta rho sigma and when I pull it once I will get twice eta mu sigma times trace gamma mu gamma rho which is minus 8 eta mu rho eta mu sigma and then plus trace of gamma mu gamma sigma gamma mu gamma rho.

Now, in this expression again, I will pull it once then what I get is 8 eta mu nu eta rho sigma minus 8 eta mu rho eta mu sigma plus, this will give you twice eta mu sigma times trace of gamma mu gamma rho which is 8 eta sigma eta mu rho minus trace gamma sigma gamma mu gamma mu gamma rho, but this quantity is same as this. So, if you bring it here this will give twice trace of trace of gamma mu gamma mu gamma rho gamma sigma is equal to 8 times this quantity therefore, the trace of 4 gamma matrices is given by this.

(Refer Slide Time: 26:29)

$$\begin{aligned}
 \text{First term} &= 2(p.k) \operatorname{tr}(K' K' \phi' \phi \phi' \phi) & \phi K &= -K \phi \\
 & & \phi' K' &= -K' \phi' \\
 &= 2(p.k) \operatorname{tr}(K' K' \phi' \phi \phi' \phi) \\
 &= 2(p.k) \frac{1}{2} \operatorname{tr}((K' K' + K' K) \phi' \phi \phi' \phi) \\
 &= 2(p.k)(p.k') \operatorname{tr}(\phi' \phi \phi' \phi) = 2(p.k)(p.k') \\
 \operatorname{tr}(\phi' \phi \phi' \phi) &= 4 \eta^{\mu\nu} \eta^{\rho\sigma} - 4 \eta^{\mu\sigma} \eta^{\nu\rho} + 4 \eta^{\mu\sigma} \eta^{\nu\rho} \\
 &= 8(p.k)(p.k')(2(\epsilon-1)^2 - 1)
 \end{aligned}$$

So, now that we have proved this relation, I can use this two- two derive this trace. This will simply given by twice p 0 k p 0 k prime times 4 the first term mu nu rho sigma will give you epsilon 0 epsilon prime whole square. Then you have minus eta mu rho eta sigma will say that first one will have 0 product with the third one, second one will have with forth one. So, minus 4 epsilon 0 epsilon prime dot epsilon prime and finally, the last term will say that, it is again the epsilon prime 0 epsilon whole square. So, plus 4 epsilon prime 0 epsilon whole square, what is this quantity here this is one with epsilon 0 epsilon is minus 1. So, therefore, this term here is evaluate as 8 p 0 k p 0 k prime times twice epsilon 0 epsilon prime whole square minus 1.

So, now that we have evaluated the first term this T 2 has two terms, the first term we have evaluated and then we have shown that this is equal to this, now we will come back to the second term here and then we will evaluate this in more detail.

(Refer Slide Time: 28:46)

$$\begin{aligned}
 &= \text{Tr}(\phi' \phi K (X+m) X' \phi' \phi (X+m)) && p+k = p+k \\
 &= \text{tr}(\phi' \phi K (X+m) X' \phi' \phi ((X+m) + (K-K))) \\
 &= \text{tr}(X(X+m) X' \phi' \phi (X+m) \phi' \phi) + \text{tr}(X(X+m) X' \phi' \phi (K-K) \phi' \phi) \\
 \text{term:} &= 8(p+k)(p+k)(2(\epsilon')^2 - 1) && \begin{matrix} k' = 0 \\ X' \phi' = \phi' X' \end{matrix} \\
 \text{nd term:} &= \text{tr}(X(X+m) X' \phi' \phi (K-K) \phi' \phi) && (X-K) \phi' \phi \\
 &= \text{tr}(X X X' \phi' \phi (K-K) \phi' \phi) && = (2(p+k) - \phi' K + \phi' K') \phi
 \end{aligned}$$

So, let us summarize what we got here. We got the first term to be equal to  $8(p+k)(p+k)(2(\epsilon')^2 - 1)$ , now we need to evaluate the second term. So, let us look at the second term, it is  $\text{tr}(X(X+m) X' \phi' \phi (K-K) \phi' \phi)$ , then it comes again, you see this involves there are two terms.

So, one with  $p$  slash contains  $8$  gamma matrices, but the one with  $m$  has  $7$  gamma matrices. So, the terms linear in  $m$  will simply vanish therefore, this is  $\text{tr}(X X X' \phi' \phi (K-K) \phi' \phi)$ . So, now I will focus on the last three terms. Here what I will get is  $k$  slash minus  $k$  slash minus  $k$  prime slash times  $\epsilon$  prime slash  $\epsilon$  slash, now you try to move this  $\epsilon$  slash to the  $\epsilon$  prime slash. So, this side then what you will get the first term will have twice  $k \cdot \epsilon$  prime minus  $\epsilon$  prime slash  $k$  slash and here  $k$  prime slash  $\epsilon$  slash is simply  $\epsilon$  prime slash  $k$  prime slash with the minus sign.

So, this is  $\epsilon$  prime slash  $k$  prime slash  $k$  prime slash the whole thing multiplied by  $\epsilon$  slash because  $k$  prime dot  $\epsilon$  prime is equal to  $0$ . We are considering transfer proton therefore,  $k$  prime slash  $\epsilon$  slash is minus  $\epsilon$  prime slash  $k$  prime slash. So, now this is to be inserted here, let us see what you get when you set this.

(Refer Slide Time: 32:03)

$$\begin{aligned}
 \text{term} &= \text{tr}(\not{x} \not{x}' \not{k}' \not{\epsilon}' \not{\epsilon} (2 \not{k} \not{\epsilon}') \not{\epsilon}) = \text{tr}(\not{x} \not{x}' \not{k}' \not{\epsilon}' \not{\epsilon} \not{\epsilon}' \not{k} \not{\epsilon}) + \text{tr}(\not{x} \not{x}' \not{k}' \not{\epsilon}' \not{\epsilon} \not{\epsilon}' \not{k} \not{\epsilon}) \\
 &= 2(\not{k} \cdot \not{\epsilon}') \text{tr}(\not{x} \not{x}' \not{k}' \not{\epsilon}' \not{\epsilon} \not{\epsilon}') + \text{tr}(\not{x} \not{x}' \not{k}' \not{\epsilon}' \not{\epsilon} \not{\epsilon}' \not{k} \not{\epsilon}) \\
 &= -2(\not{k} \cdot \not{\epsilon}') \text{tr}(\not{x} \not{x}' \not{k}' \not{\epsilon}') - \text{tr}(\not{x} \not{x}' \not{k}' \not{\epsilon}' \not{\epsilon} \not{\epsilon}' \not{k} \not{\epsilon}) \\
 &= -2(\not{k} \cdot \not{\epsilon}') \text{tr}(\not{x} \not{x}' \not{k}' \not{\epsilon}') + 2(\not{\epsilon} \cdot \not{k}) \text{tr}(\not{k} \not{x}' \not{\epsilon}') \\
 &= -2(\not{k} \cdot \not{\epsilon}') 4((\not{k} \cdot \not{p})(\not{p}' \cdot \not{\epsilon}') - (\not{k} \cdot \not{p}')(\not{p} \cdot \not{\epsilon}') + (\not{k} \cdot \not{\epsilon}')(\not{p} \cdot \not{p}')) + 2(\not{\epsilon} \cdot \not{k}) \\
 &= -8(\not{k} \cdot \not{\epsilon}')^2 (\not{p} \cdot \not{k}') + 8(\not{\epsilon} \cdot \not{k}')^2 (\not{p} \cdot \not{k})
 \end{aligned}$$

**DR. PRASANTA KUMAR TRIPATHY**  
 Department of Physics

So,  $k$  slash  $p$  slash  $p$  prime  $\epsilon$  prime then this is twice  $\epsilon$  prime  $\epsilon$  slash this is the first term and then you have trace of  $\eta$  minus trace of  $k$  slash  $p$  slash  $k$  prime slash  $\epsilon$  prime slash  $\epsilon$  slash  $\epsilon$  prime slash  $\epsilon$  slash and finally, trace of  $k$  slash  $k$  prime slash  $\epsilon$  prime slash  $\epsilon$  slash  $\epsilon$  slash  $k$  slash  $\epsilon$  slash. Now, you just look at the second term here, I can click  $k$  and  $\epsilon$  using this fact  $k$  slash  $\epsilon$  slash is minus  $\epsilon$  slash  $k$  slash, then there is the  $k$  slash here one, but there is one  $k$  slash here, you use the cyclic property of trace you bring this  $k$  slash here that will give you  $k$  slash square which is 0.

So, the second term here when it is because of this. Now, we are left with first and last term one prime slash  $k$  prime slash. So, this is twice  $k$  0  $\epsilon$  prime trace of  $k$  slash  $p$  slash  $k$  prime slash  $\epsilon$  prime slash  $\epsilon$  slash  $\epsilon$  slash. This is one term and the second term I have seen. So,  $k$  slash  $p$  slash  $k$  prime slash  $\epsilon$  prime slash  $\epsilon$  slash  $\epsilon$  slash  $\epsilon$  slash. So, let us look at this term here there are two  $\epsilon$  slash. So, therefore, this is the minus 1. So, this term here is minus twice  $k$  0  $\epsilon$  prime trace of  $k$  slash  $p$  slash  $k$  prime slash  $\epsilon$  slash and then you have this term here which I have to simplify, here this involves of 4 gamma matrices.

So, I know how to do that. Here also what I can do is I can just rearrange things, so that this again reduces to something which involves trace of 4 gamma matrices and then I can evaluate that in strait for manners  $\epsilon$  dot  $k$  prime. So, let us focus this term here and

then I will click this  $k^\prime \epsilon^\prime$ . I will get a minus sign. So, minus trace of  $k^\prime \epsilon^\prime$  slash  $p^\prime$  slash  $k^\prime \epsilon^\prime$  slash  $\epsilon^\prime$  slash  $\epsilon^\prime$  slash and then this is a prime slash  $\epsilon^\prime$  slash  $\epsilon^\prime$  slash this is 1, then what I will do is that I will again take this  $k^\prime$  to this side that will give me two terms, one of them will be simply, so minus  $k^\prime \epsilon^\prime$  slash  $\epsilon^\prime$  slash plus twice  $\epsilon^\prime_0 k^\prime$  that is what I will get from here. Now, you can see the first term which contain minus  $k^\prime \epsilon^\prime$  slash it comes with  $k^\prime \epsilon^\prime$  here.

So, what you get here for the first term is something which involves  $k^\prime \epsilon^\prime$  slash  $k^\prime \epsilon^\prime$  slash. What is the quantity this is 0, because this again you can flip it then you get  $k^\prime \epsilon^\prime$  slash  $\epsilon^\prime_0$  which is  $k^\prime \epsilon^\prime$  slash  $\epsilon^\prime_0$  which is 0. So, therefore, this term is simply 0. So, what you get is minus twice  $k^\prime \epsilon^\prime$  slash  $p^\prime$  slash  $k^\prime \epsilon^\prime$  slash  $\epsilon^\prime$  slash and here you have minus twice  $\epsilon^\prime_0 k^\prime$  times trace of  $k^\prime \epsilon^\prime$  slash  $p^\prime$  slash  $k^\prime \epsilon^\prime$  slash  $\epsilon^\prime$  slash and here again  $\epsilon^\prime$  slash  $\epsilon^\prime$  slash alright because for this I simply substituted the twice  $\epsilon^\prime_0 k^\prime$ . Now, you have again  $\epsilon^\prime$  slash  $\epsilon^\prime$  slash square which will give you 1 minus sign. So, this quantity here is plus  $\epsilon^\prime_0$  slash 2  $\epsilon^\prime_0 k^\prime$  slash  $\epsilon^\prime$  slash good. So, we have started this term and then we have reduce it to two sum of two terms which involves trace of 4 gamma matrices therefore, we can easily compute them, lets the right the answer for that minus twice  $k^\prime \epsilon^\prime$  slash  $p^\prime$  slash  $k^\prime \epsilon^\prime$  slash  $\epsilon^\prime$  slash times four times this is  $k^\prime_0 p^\prime_0 k^\prime_0 \epsilon^\prime_0$  slash  $\epsilon^\prime_0$  slash minus  $k^\prime_0 k^\prime_0 p^\prime_0 \epsilon^\prime_0$  slash  $\epsilon^\prime_0$  slash plus  $k^\prime_0 \epsilon^\prime_0 p^\prime_0 k^\prime_0$  slash  $\epsilon^\prime_0$  slash, that is for the first term and similarly for the second term. I have twice  $\epsilon^\prime_0 k^\prime$  times 4  $k^\prime_0 \epsilon^\prime_0 p^\prime_0 k^\prime_0$  slash  $\epsilon^\prime_0$  slash minus  $k^\prime_0 k^\prime_0 p^\prime_0 \epsilon^\prime_0$  slash  $\epsilon^\prime_0$  slash plus  $k^\prime_0 \epsilon^\prime_0 p^\prime_0 k^\prime_0$  slash  $\epsilon^\prime_0$  slash.

But, now you use to fact that the photon polarization as transverse and then we are working in the laboratory frame. So, that is again orthogonal to  $p^\prime$ . So,  $p^\prime_0 \epsilon^\prime_0$  and  $p^\prime_0 \epsilon^\prime_0$  slash at 0 therefore, this term is here as 0, which is beta  $p^\prime_0 \epsilon^\prime_0$  slash here and because 14 polarization is transverse  $k^\prime_0 \epsilon^\prime_0$  slash. Now, here similarly this terms survives, but  $p^\prime_0 \epsilon^\prime_0$  slash is 0 and  $k^\prime_0 \epsilon^\prime_0$  slash is again 0. We can photon polarizations is transverse. So, now, I will put all this things together, then what I get is minus twice  $k^\prime_0 \epsilon^\prime_0$  slash, there is the factor of 4. So, 8  $k^\prime_0 \epsilon^\prime_0$  slash times  $k^\prime_0 \epsilon^\prime_0$  slash square  $k^\prime_0 k^\prime_0$  slash and the second term is again plus  $k^\prime_0 \epsilon^\prime_0$  slash square  $p^\prime_0 k^\prime_0$  slash. So, this is what we got for the second term.

(Refer Slide Time: 43:52)

So, the first term is this and the second term is a  $8 \epsilon_0 k_0 \text{ prime square } k_0 k_0 \text{ minus } 8 \epsilon_0 \text{ prime } k_0 \text{ square } k_0 k_0 \text{ prime}$ . So,  $T_2$  is nothing, but some of these two terms therefore, I can simply add them to get  $T_2$ .

(Refer Slide Time: 44:42)

So,  $8 p_0 k_0 p_0 k_0 \text{ prime times } 0 \epsilon_0 \text{ prime square minus } 1 \text{ plus } 8 p_0 k_0 \epsilon_0 k_0 \text{ prime square minus } 8 k_0 k_0 \text{ prime } \epsilon_0 \text{ prime } k_0 \text{ square}$  this is our  $T_2$ .

Now, I have to find  $T_3$  from here, but you can see that, if you make this transformation method  $\epsilon$  goes to  $\epsilon'$  and  $k$  goes to  $-k'$ , then here it will keep

two minus sign. Here to tell  $k$  because minus  $k$  prime  $k$  prime goes to minus  $k$  therefore, this whole thing is invariant here  $\epsilon$  and  $\epsilon'$  are inter change this is whole square. So, the factor which is invariant and under this exchange the second term goes to the third term because there is the minus  $p_0 k$  prime here and this is  $\epsilon$  prime  $0 k$  and this term goes to this. So, the second and third term interchange and the first term remain invariant.

Therefore,  $T_2$  is invariant under this transformation, but we have seen earlier that if we make this transformation in the original trace, then we get  $T_3$ . This simply implies that  $T_2$  is equal to  $T_3$ . So, what we have done is we have derived an expression for  $T_1 T_2 T_3$  and  $T_4$ . We will put all these things together and then we will see what we get for  $x$ . So, let me write the answer for  $T_1$  and  $T_2$ .  $T_1$  is equal to  $8 p_0 k$  twice  $\epsilon$  prime  $0 k$  square plus  $p_0 k$  prime and hence  $T_4$  is equal to minus  $8 p_0 k$  prime twice  $\epsilon$   $0 k$  prime square minus  $p_0 k$ .

(Refer Slide Time: 47:50)

$$x = \frac{1}{16m^2(p.k)^2} T_1 + \frac{1}{16m^2(p.k)(p.k')} (T_2 + T_3) + \frac{1}{16m^2(p.k)k'} T_4$$

$$= \frac{1}{2m^2} \left( \frac{k_0'}{k_0} + \frac{k_0}{k_0'} + 4(\epsilon\epsilon')^2 - 2 \right)$$

$$d\sigma = \frac{\alpha^2}{2} x \left( \frac{k_0'}{k_0} \right)^2 d\Omega$$

$$\Rightarrow \frac{d\sigma}{d\Omega} = \frac{\alpha^2}{4m^2} \left( \frac{k_0'}{k_0} \right)^2 \left( \frac{k_0'}{k_0} + \frac{k_0}{k_0'} + 4(\epsilon\epsilon')^2 - 2 \right)$$

This is your  $T_1 T_2 T_3 T_4$  and your  $x$  is  $1$  over  $16 m$  square  $p_0 k$  square  $T_1$  plus  $1$  over  $16 m$  square  $p_0 k p_0 k$  prime  $T_2$  plus  $T_3$  and plus  $1$  over  $16 m$  square  $p_0 k$  prime square  $T_4$ . Now, I will substitute for  $T_1 T_2 T_3 T_4$  and then you will see that after little bit of simplification this quantity will reduce to this simple expression  $1$  over  $2 m$  squares  $k_0$  prime over  $k_0$  plus  $k_0$  over  $k_0$  prime plus  $4 \epsilon$   $0 \epsilon$  prime square minus  $2$ . This is what we get for  $x$  and  $d \sigma$  is nothing but  $\alpha$  square over  $2$  into  $x$

into  $k_0 \text{ prime over } k_0 \text{ whole square } d \omega$ . If you look at what we discussed in the earlier lectures, therefore it simply implies the  $\sigma$  over  $d \omega$  is equal to  $\alpha^2$  over  $4 m^2$ . I will simply substitute this for  $x$ , here then what I get is  $k_0 \text{ prime over } k_0 \text{ square times } k_0 \text{ prime over } k_0 \text{ plus } k_0 \text{ over } k_0 \text{ prime plus } 4 \epsilon_0 \text{ prime }^2 \text{ square minus } 2$ .

So, this is the expression for the differential scale scattering cross section that we got after doing the complicated calculation. I will briefly tell you, what we can do is that we can also average over the photon polarization. We can also assume that our initial photon is un-polarized and we also do not detect the final photon polarization, then all other terms have been now effected except, this one because this involves term photo polarization. what I claim is that if you consider this.

(Refer Slide Time: 50:41)

$$\frac{1}{2} \sum_{\epsilon, \epsilon'} (\epsilon \cdot \epsilon')^2 = \frac{1}{2} \cos^2 \theta$$

$$\cos \theta = \frac{\vec{k} \cdot \vec{k}'}{|\vec{k}| |\vec{k}'|}$$

So, you have half  $\epsilon_0 \epsilon_0 \text{ prime whole square sum of a our } \epsilon$  and  $\epsilon \text{ prime}$  all possible values of  $\epsilon$  and  $\epsilon \text{ prime}$  this is half  $\cos^2 \theta$ , where  $\theta$  is simply equal to  $\cos \theta$  is  $k_0 k_0 \text{ prime } k_0 \text{ mode } k_0 \text{ prime}$  its angle, but in the initial and the final photon you can show this and you can substitute it in the expression for the differential scattering from cross section and find this scattering cross section when the electron as well as the photon un-polarized.
