In the last lecture that I gave, I discussed the uncertainty principle. In general, uncertainty principle where we had the relation

(Refer Slide Time: 00:24)

That the variance in the measurement of A, times the variance in the measurement of b is greater than or equal to, the right hand side had two contributions: one had the commutator of A with B it is expectation value mod square times quarter, and the other had the modulus of the expectation value of the anticommutator of A minus expectation value of A, with B minus expectation value of B.

We looked at two cases. The 1st case, we looked at was the spin system or equivalently the 2 level atom model where we computed this, in the state ket e which was an Eigen state of  $S_z$ , with Eigen value  $\hbar/2$ . We found that this quantity, was greater than or equal to a finite non zero number. That is because the spread in  $S_y$  was non zero and the spread in  $S_x$  was non zero. Then we looked at the 2nd example, where we computed this in the state ket e again. So, we were looking at an Eigen state of  $S_z$ . So clearly, this object was 0 and therefore: the product was 0 but we also saw that the spread in  $S_x$  was not 0. So that was the 2nd example that we had. The 3rd example: that I started looking at, was a linear harmonic oscillator. The quantum linear harmonic oscillator which was what we will do in some detail today.

(Refer Slide Time: 02:42)

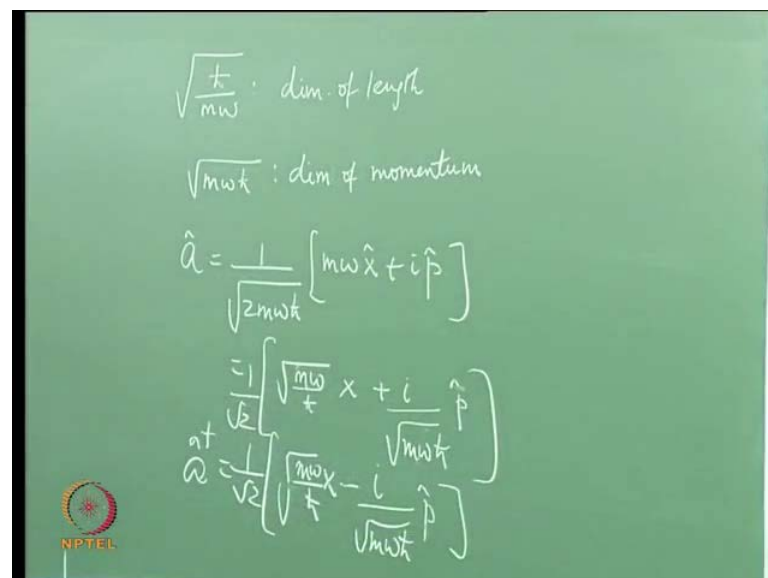

So, we will be looking at the linear harmonic oscillator, the simple harmonic oscillator. And, as I indicated yesterday: we could start from the classical Hamiltonian. By p, I mean the linear momentum corresponding to the variable x. So, the generalized coordinate is x, the generalized momentum is p. Of course, x would be a function of time

and so would  $t$  be a function of time. But right now, we are not discussing dynamics at all. So, I have this oscillator with  $p$  squared by  $2m$  plus half  $m\omega$  squared  $x$  squared as the Hamiltonian, the classical Hamiltonian.

So, the quantum Hamiltonian, which I will merely call  $H$  would mean, replace all dynamical variables by operators. And of course, in this case with the understanding with the commutator of  $x$  with  $p$ , is  $i\hbar$  cross times the identity. The point is this: I would like to create some dimensionless operators using  $x$  and  $p$  and as I indicated yesterday, we can produce two operators  $a$  and  $a^\dagger$ , which are functions of the operators  $x$  and  $p$ . And today, I will put in the  $m\omega\hbar$  cross everything in the right place and define them as follows:

(Refer Slide Time: 04:33)

Handwritten equations on a green chalkboard:

$$\sqrt{\frac{\hbar}{m\omega}} : \text{dim. of length}$$

$$\sqrt{m\omega\hbar} : \text{dim of momentum}$$

$$\hat{a} = \frac{1}{\sqrt{2m\omega\hbar}} [m\omega\hat{x} + i\hat{p}]$$

$$= \frac{1}{\sqrt{2}} \left[ \sqrt{\frac{m\omega}{\hbar}} \hat{x} + i \frac{\hat{p}}{\sqrt{m\omega\hbar}} \right]$$

$$\hat{a}^\dagger = \frac{1}{\sqrt{2}} \left[ \sqrt{\frac{m\omega}{\hbar}} \hat{x} - i \frac{\hat{p}}{\sqrt{m\omega\hbar}} \right]$$

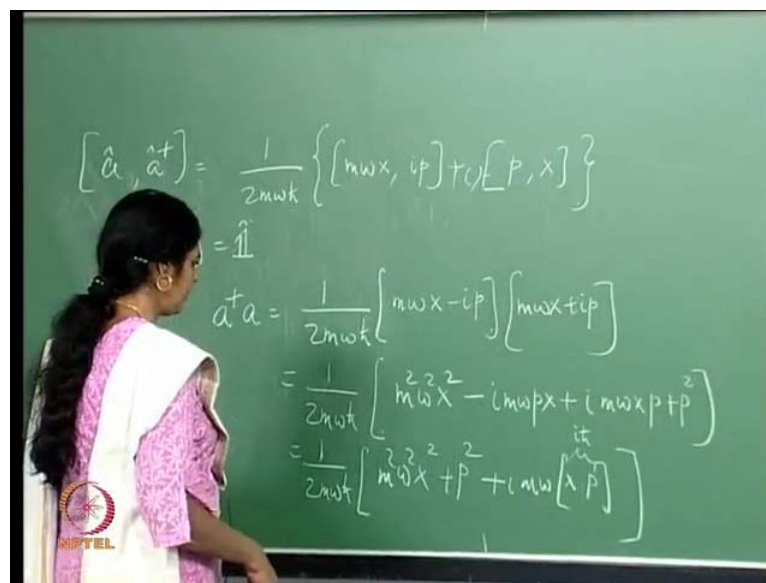

NPTEL logo is visible in the bottom left corner of the slide.

The object root of  $\hbar$  cross by  $m\omega$  has dimensions of length: that is frequency, that is mass, and that is action which is energy second. And therefore, this combination has dimensions of length, root of  $m\omega\hbar$  cross is dimensions of momentum. So, if I remember this and I write  $a$  as the combination I have removed the caps of the operators, you would normally do that. But, I believe it is good for us to just remember that  $x$  and  $p$  are operators, even if the caps were not put on top of them. You see this object, is simply  $1/\sqrt{2}$ , root of  $m\omega$  by  $\hbar$  cross  $x$  plus  $i$  by root of  $m\omega\hbar$  cross  $p$ .

Looking at this, it is clear that I have divided out length here, and I have divided out momentum there, to create this object  $a$ : an operator which is dimensionless, a dagger is its Hermitian conjugate. So, this is what I have.

Now, you can find the commutator of  $a$  with  $a$  dagger and that is simply one. Using, the fact that the  $x$   $p$  commutator is  $i \hbar$  cross times identity. The commutator of  $x$  with  $x$  is zero. The commutator of  $x$  with  $p$  is  $i \hbar$  cross and pull out all these constants. Similarly, the commutator of  $p$  with  $x$  will give me minus  $i \hbar$  cross, apart from these constants.

(Refer Slide Time: 07:23)

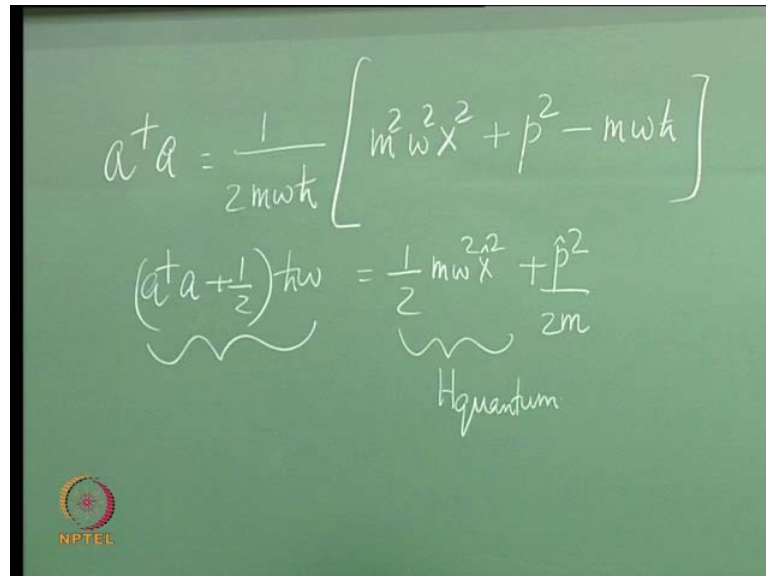

$$\begin{aligned}
 [a, a^\dagger] &= \frac{1}{2m\omega\hbar} \{ [m\omega x, ip] + [p, x] \} \\
 &= \hat{1} \\
 a^\dagger a &= \frac{1}{2m\omega\hbar} [m\omega x - ip][m\omega x + ip] \\
 &= \frac{1}{2m\omega\hbar} \left[ m^2\omega^2 x^2 - im\omega p x + im\omega x p + p^2 \right] \\
 &= \frac{1}{2m\omega\hbar} \left[ m^2\omega^2 x^2 + p^2 + im\omega [x, p] \right]
 \end{aligned}$$

The commutator of  $p$  with  $p$  is 0 and that is how I get  $a$  dagger is 1 by 1 I mean, the identity operator. So, I could have written commutator  $x$   $p$  is  $i \hbar$  cross times identity or I could have written commutator  $a$   $a$  dagger is equal to 1. Now, given this operator we would like to recast the Hamiltonian, the oscillator Hamiltonian in terms of  $a$  and  $a$  dagger. So, let us just find out what is the object  $a$  dagger  $a$ . So,  $a$  dagger  $a$  is  $1$  by  $2$   $m$   $\omega$   $\hbar$  cross. So,  $a$  dagger is  $m$   $\omega$   $x$  minus  $i$   $p$  and  $a$  is  $m$   $\omega$   $x$  plus  $i$   $p$  and that is going to be  $a$  dagger  $a$ .

So, let us work this out; one has to keep the order carefully. I have the first term  $m$  squared  $\omega$  squared  $x$  squared then I have minus  $i$   $m$   $\omega$   $p$   $x$ . These are operators, so I should be careful; plus  $i$   $m$   $\omega$   $x$   $p$  plus  $p$  squared. Well, that is simply  $1$  by  $2$   $m$   $\omega$   $\hbar$  cross,  $m$  squared  $\omega$  squared  $x$  squared, plus  $p$  squared, plus  $i$   $m$   $\omega$

commutator of  $x$  with  $p$ . But, the commutator of  $x$  with  $p$  is  $i\hbar$  cross. And therefore, this object simplifies and we get an expression for  $a^\dagger a$ .

(Refer Slide Time: 09:31)

$$a^\dagger a = \frac{1}{2m\omega\hbar} \left[ m^2\omega^2 x^2 + p^2 - m\omega\hbar \right]$$

$$\underbrace{\left( a^\dagger a + \frac{1}{2} \right) \hbar\omega}_{H_{\text{quantum}}} = \underbrace{\frac{1}{2} m \omega^2 x^2}_{H_{\text{quantum}}} + \underbrace{\frac{p^2}{2m}}_{H_{\text{quantum}}}$$

I pull out a  $1$  by  $2 m \omega \hbar$  cross and then I have  $m$  squared  $\omega$  squared  $x$  squared, plus  $p$  squared minus  $m \omega \hbar$  cross. Now,  $a$  and  $a^\dagger$  are dimensionless objects by construct. So, as you can see this is dimensionless and  $\omega \hbar$  cross has dimensionless of  $p$  squared. Ensure, I have an  $m \omega$  by  $\hbar$  cross when I combine this factor with  $m$  squared  $\omega$  squared, and that has the dimensions of  $x$  squared. So, it is ok as it starts, and now we can check that  $a^\dagger a$  plus half,  $\hbar \omega$  cross to give me dimensions of energy is simply half  $m \omega$  squared  $x$  squared plus  $p$  squared by  $2 m$ . All I have done, is pull out this factor.

There is a minus half that comes between this and that I pulled it to this side. This is dimensionless. Multiplied it with  $\hbar \omega$  cross to give it dimensions and that is simply the rest of it which we recognized with the operator sign on top there, with the hat there. This we recognize as  $\hbar$  quantum and so you see. I can write the Hamiltonian for the quantum oscillator as  $p$  squared by  $2 m$  plus half  $m \omega$  squared  $x$  squared or as  $a^\dagger a$  plus half  $\hbar \omega$  cross. So, let us see what is the physical significance of the operators  $a$  and  $a^\dagger$ .

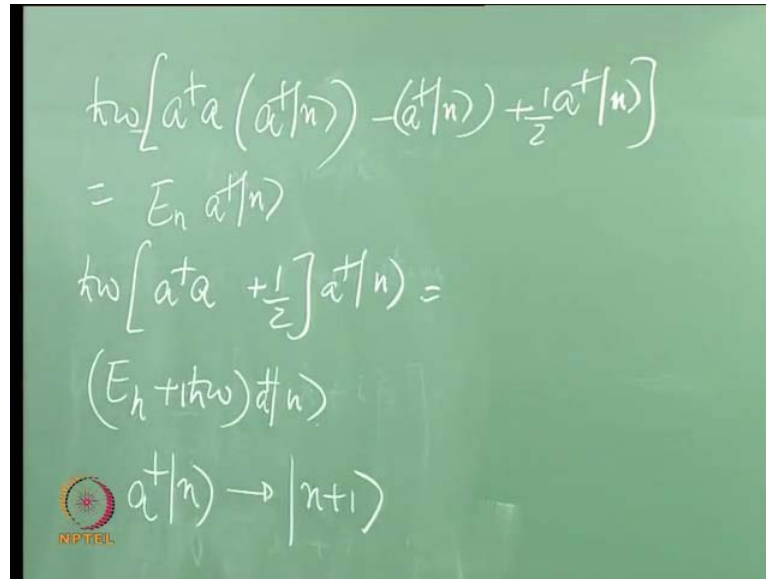

(Refer Slide Time: 11:55)

Consider, the Hamiltonian  $a^\dagger a + \frac{1}{2} \hbar \omega$ . This is the quantum Hamiltonian. Look at Eigen states of  $H$ . We will label them by ket  $n$  where  $n$  is a label. One has to find out the range of values that  $n$  can take. So, Eigen values would be given by  $E_n$  and these are numbers that one has to find out. I therefore, have  $a^\dagger a + \frac{1}{2} \hbar \omega$  acting on  $n$ , gives me  $E_n$ .

Let us multiply this by  $a^\dagger$  on both sides. So, this is what I have. Well, I can do the following thing: I remember that  $a^\dagger a$  commutator is 1 which means, that  $a^\dagger a - a a^\dagger = 1$ . So, I can recast  $a^\dagger a$  in terms of  $a a^\dagger$ . Therefore, I have  $\hbar \omega a^\dagger a + \frac{1}{2} \hbar \omega$ , that is the 1st term, plus  $\frac{1}{2} \hbar \omega$  acting on ket  $n$ . That is, the left hand side is  $E_n a^\dagger$  acting on ket  $n$ . I can do better, I would now say:

(Refer Slide Time: 13:59)

$$\begin{aligned} & \hbar\omega \left[ a^\dagger a (a^\dagger |n\rangle) - (a^\dagger |n\rangle) + \frac{1}{2} a^\dagger |n\rangle \right] \\ &= E_n a^\dagger |n\rangle \\ & \hbar\omega \left[ a^\dagger a + \frac{1}{2} \right] a^\dagger |n\rangle = \\ & (E_n + \hbar\omega) a^\dagger |n\rangle \\ & a^\dagger |n\rangle \rightarrow |n+1\rangle \end{aligned}$$

That  $\hbar\omega$  cross  $a^\dagger a$  from the 1st term and I have a dagger ket  $n$ , that is the 1st term, minus a dagger ket  $n$ , plus half a dagger ket  $n$ , that quantity is  $E_n a^\dagger |n\rangle$ . In other words, I have shown that, that object is  $E_n$  plus  $1 \hbar\omega$ , a dagger acting on ket  $n$ , a dagger acting on ket  $n$  is a state which is an Eigen state of the Hamiltonian, the oscillator Hamiltonian with Eigen value  $E_n$  plus  $1 \hbar\omega$ . So, it looks like a dagger acts on ket  $n$  to take it to a state which is  $E_n$  plus  $1 \hbar\omega$ . So, I would like to call that  $n+1$  by way of notation because to the original energy  $E_n$ , we have added an amount  $1 \hbar\omega$ .

So, physically it looks like a dagger takes the system from a state of lower energy  $E_n$  to a state of higher energy:  $E_n$  plus  $1 \hbar\omega$ . This is the increase in the energy. So, that is an excited state compared to the state with energy  $E_n$ . So, repeated application of a dagger on a given state will increase the total energy by  $1 \hbar\omega$  each time, taking us to different states from ket  $n$ , we go to a state ket  $n+1$ , ket  $n+2$ , ket  $n+3$  and so on. I want to emphasize the fact that  $n$  is just a label. We have to find out the range of values that  $n$  will take but as of now  $n$  is merely a label. Similarly, we can find out what happens when  $a$  acts on ket  $n$ . So, let us do that.

(Refer Slide Time: 16:43)

So, again we begin with the Hamiltonian and the Eigen value equation and this time multiply by  $a$ . So,  $a a^\dagger a + \frac{1}{2} a$  ket  $n$  is  $E_n a$  ket  $n$ . Well, certainly that tells us that  $a a^\dagger a + \frac{1}{2} a$  ket  $n$  is  $E_n a$  ket  $n$ . And, this object using the commutation relation (Refer Slide Time: 11:55) we have got  $a a^\dagger$  there. So,  $a a^\dagger$  is  $1 + a^\dagger a$ . In other words, what I have shown is this. When  $a$  acts on ket  $n$  it takes it to a state which is also an Eigen state of the Hamiltonian but with the energy reduced by  $1 \hbar \omega$ . So, repeated application of  $a$  on a given state ket  $n$  seems to reduce its energy each time by  $1 \hbar \omega$  taking it to a new state and therefore,

(Refer Slide Time: 18:28)

In the notation that I have used should be labeled as the state  $n - 1$ . So,  $a^\dagger$  is called the raising operator and  $a$  is called the lowering operator. Because  $a^\dagger$  raises the energy of the original state by  $\hbar \omega$  taking it to a new state of the harmonic oscillator, both the original state and the new state are Eigen states of the oscillator Hamiltonian, energy Eigen states.

Similarly,  $a$  acting on a given state lowers the energy in steps of  $\hbar \omega$  taking us to new states:  $n - 1$ ;  $n - 2$  and so on, which label the states. So  $n$  is a label. So now, let us look at the following: the Hamiltonian itself when written in terms of  $x$  and  $p$ , it is clear that it is a quadratic form. There is an  $x^2$  and there is a  $p^2$ . Take any operator of the form  $A^2$ . Suppose  $\psi$  is an Eigen state of  $A^2$  with Eigen value, I can just call it  $\alpha$  for the moment  $\alpha \psi$ . Then  $\psi A^2 \psi$ , this is a Hermitian operator, is  $\psi A A \psi$ . I could call  $A \psi$ , as the state  $\chi$  and therefore this is the bra.

So, this object is the inner product  $\chi \chi$ . On the left hand side, I have  $\alpha \psi \psi$  and if this is normalized to 1 I have  $\chi \chi$  is equal to  $\alpha$ . The inner product of the state  $\chi$  with itself is equal to  $\alpha$ . But, as we know inner products are greater than or equal to 0. And therefore, the operator of this form can have only an Eigen value which is non negative. The same thing happens in the case of the harmonic oscillator because  $x^2$  is the square of the operator  $x$  and  $p^2$  is the square of the operator  $p$ .

And therefore, the Hamiltonian is a positive operator and will have an Eigen value which is non negative. So, it is clear that when the energy gets reduced by repeated application of the lowering operator  $a$ , we cannot get to a stage where the net energy becomes negative. Now, that is an important point because it tells us that finally, by repeated application of  $a$ .

(Refer Slide Time: 21:33)

We will get to the lowest energy state which I will call, the minimum energy state or ground state. It is not the null vector. It need not be a state with energy value equal to 0. This is simply a label. So,  $n$  is equal to 0 denotes the lowest energy state. So, we get to this lowest energy state such that when I act with  $a$  on that state it should simply give me 0. It cannot take it to another state which has an energy which is negative. And therefore, the ground state is a state with positive energy or definitely non negative energy and when  $a$  acts on the ground state, it cannot take it to any other state which has got negative energy.

So, the spectrum therefore; the Eigen spectrum of the Hamiltonian has a ket zero, when  $n$  is zero. I can use  $a^\dagger$  and go to ket 1 which has got energy corresponding to the state ket 0 plus  $1 \hbar \omega$  then  $n$  is equal to 2, which is the next state by application of  $a^\dagger$  once again on ket one. And that takes me to a state with energy of the ground state, plus  $2 \hbar \omega$  and so on. So, it looks like the states are equally spaced.

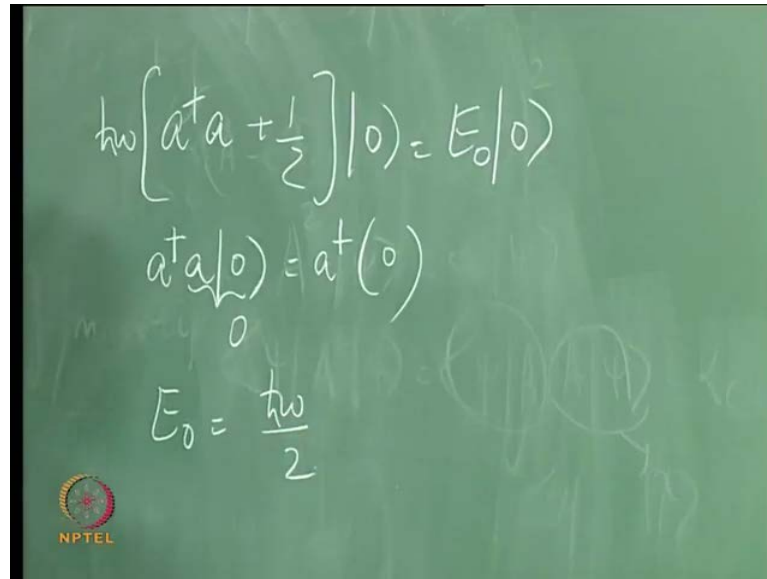

(Refer Slide Time: 23:16)

So, basically I have a ground state for the oscillator which is ket 0. This is the state on which  $a$  acts to give me the number 0. Then there is a 1st excited state. I went here by using a dagger. The ground state, let us say has energy  $E_0$  then the 1st excited state has energy,  $E_0$  plus  $1 \hbar \omega$ . Then there is a 2nd excited state, went there by using a dagger this has got energy,  $E_0$  plus  $2 \hbar \omega$ . I will call that  $E_{sub 2}$ . This is  $E_{sub 1}$  and so on.

There is no constraint on the upper bound. This is an infinite set of states which can be got by repeated application of a dagger on the ground state. Now, suppose I want to go down in the ladder. I would do it using an  $a$ . So, I could start with any state, apply  $a$  on it and bring it down to the next state that is the state with energy lower than that, the difference being  $1 \hbar \omega$ . Now, let us look at what the energy values actually are.

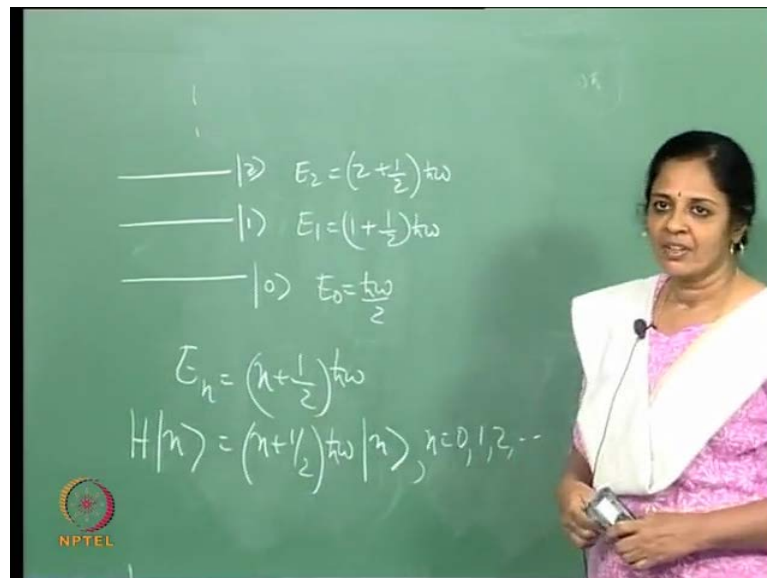

(Refer Slide Time: 24:47)

$$\hbar\omega\left[a^\dagger a + \frac{1}{2}\right]|0\rangle = E_0|0\rangle$$
$$a^\dagger a|0\rangle = a^\dagger(0)$$
$$E_0 = \frac{\hbar\omega}{2}$$

The image shows a green chalkboard with handwritten equations in white chalk. The equations are:  $\hbar\omega\left[a^\dagger a + \frac{1}{2}\right]|0\rangle = E_0|0\rangle$ ,  $a^\dagger a|0\rangle = a^\dagger(0)$ , and  $E_0 = \frac{\hbar\omega}{2}$ . There is a small NPTEL logo in the bottom left corner.

The energy values can be got using the Eigen value equation: a dagger a plus half h cross omega acting on ket 0, is e 0 ket 0. Look at the 1st term, a dagger a acting on ket 0 is, 0 because a on ket 0 is 0. And therefore that tells me, that e 0 is h cross omega by 2. I now have the complete picture.

(Refer Slide Time: 25:35)

$$\begin{aligned} & \text{---} |2\rangle \quad E_2 = \left(2 + \frac{1}{2}\right)\hbar\omega \\ & \text{---} |1\rangle \quad E_1 = \left(1 + \frac{1}{2}\right)\hbar\omega \\ & \text{---} |0\rangle \quad E_0 = \frac{\hbar\omega}{2} \end{aligned}$$
$$E_n = \left(n + \frac{1}{2}\right)\hbar\omega$$
$$H|n\rangle = \left(n + \frac{1}{2}\right)\hbar\omega|n\rangle, \quad n=0,1,2,\dots$$

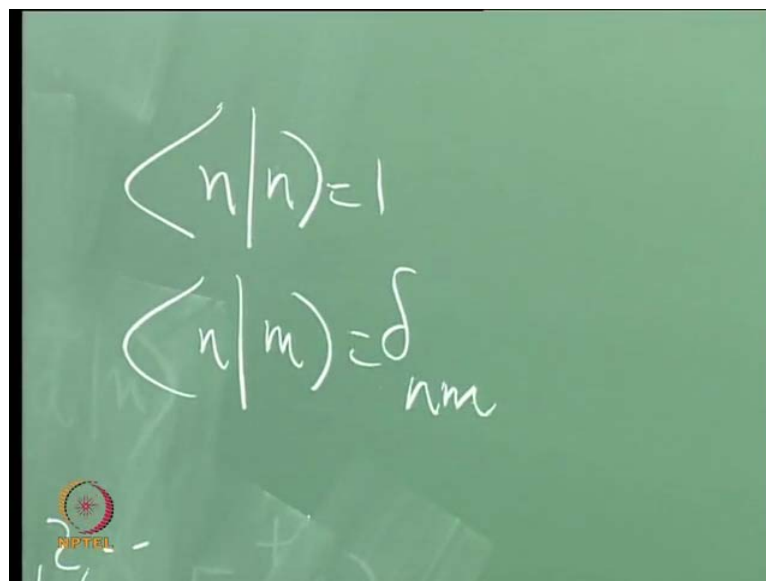

The image shows a green chalkboard with handwritten equations in white chalk. The equations are:  $E_2 = (2 + \frac{1}{2})\hbar\omega$ ,  $E_1 = (1 + \frac{1}{2})\hbar\omega$ ,  $E_0 = \frac{\hbar\omega}{2}$ ,  $E_n = (n + \frac{1}{2})\hbar\omega$ , and  $H|n\rangle = (n + \frac{1}{2})\hbar\omega|n\rangle, n=0,1,2,\dots$ . A lecturer, a woman in a pink and white sari, is standing to the right of the chalkboard. There is a small NPTEL logo in the bottom left corner.

It is clear that ket 0 has energy h cross omega by 2 which I will call the 0 point energy because the lowest energy is a non 0 positive value h cross omega by 2. Then there is ket 1 with energy E 1 which is E 0 plus h cross omega, so 1 plus half h cross omega. Then,

there is  $E_2$  with energy  $2$  plus half  $\hbar \omega$  because I would have added one more increment to this and so on. And therefore,  $E_n$  is  $n$  plus half  $\hbar \omega$ .

I can now write down the Eigen value equation;  $|n\rangle$  is an Eigen state of the Hamiltonian with energy value  $n$  plus half  $\hbar \omega$  and  $n$  takes values:  $0, 1, 2, 3$  and so on. So, this is the Eigen value equation corresponding to the harmonic oscillator. Already, we can see that in Quantum mechanics a new feature has emerged. The lowest energy is not  $0$ . The lowest energy is half  $\hbar \omega$ . Further, the energy is quantized. In contrast to the spin systems that we have seen till now, here is an infinite spectrum of states. So, it is clear that we are dealing with an infinite dimensional linear vector space. It is always possible to normalize these energy Eigen states (Refer Slide Time: 23:15). We can always use the Gram Schmidt method.

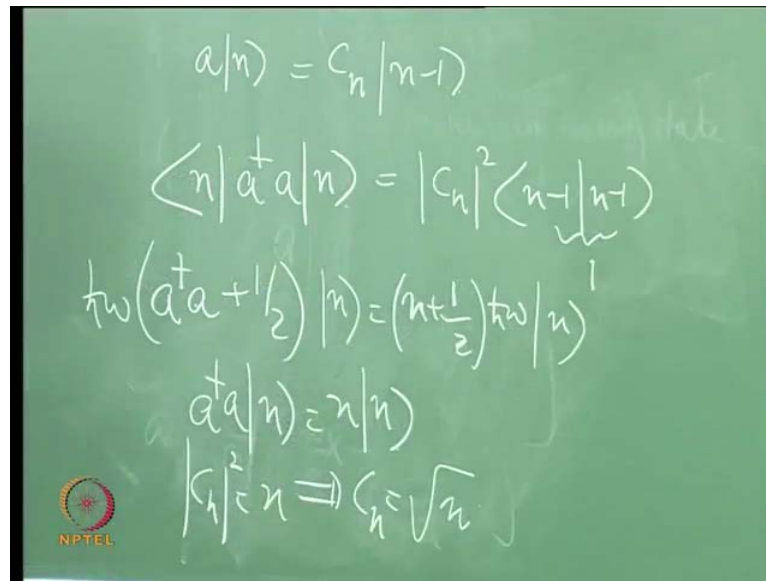

(Refer Slide Time: 27:22)

The image shows a green chalkboard with two handwritten equations in white chalk. The first equation is  $\langle n | n \rangle = 1$  and the second equation is  $\langle n | m \rangle = \delta_{nm}$ . In the bottom left corner, there is a small circular logo with a red and yellow design and the text "NPTEL" below it.

So, that in general the states are normalized to  $1$  and they are mutually orthogonal. Therefore, these would be the basis states with span. These are the energy Eigen states and they would be the basis states that span this infinite dimensional linear vector space, which has got an equally spaced energy spectrum. We have to do better. We have to find out what exactly is the action of  $a$  on  $|n\rangle$ .

(Refer Slide Time: 27:57)

The image shows a green chalkboard with handwritten mathematical equations in white chalk. The equations are as follows:

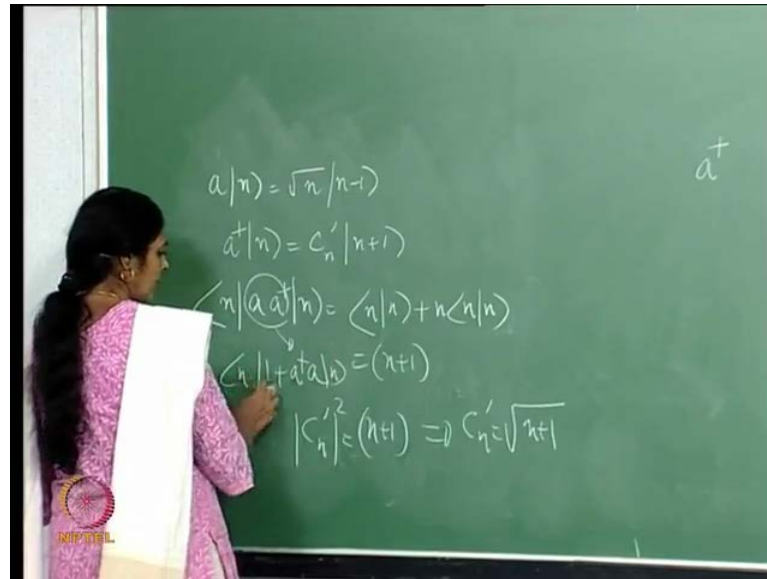

$$a|n\rangle = c_n|n-1\rangle$$
$$\langle n|a^\dagger a|n\rangle = |c_n|^2 \langle n-1|n-1\rangle$$
$$\hbar\omega\left(a^\dagger a + \frac{1}{2}\right)|n\rangle = \left(n + \frac{1}{2}\right)\hbar\omega|n\rangle$$
$$a^\dagger a|n\rangle = n|n\rangle$$
$$|c_n|^2 = n \Rightarrow c_n = \sqrt{n}$$

In the bottom left corner of the chalkboard, there is a small circular logo with a red and yellow design, and the text "NPTEL" below it.

While, we know that  $a$  on ket  $n$  takes it to a state which we label as ket  $n$  plus 1. In general, this would be true. This should be  $n$  minus 1 because  $a$  is an annihilation operator. So, we need to find out what exactly is  $C_n$ . I can always find out this object. This is simply  $\text{mod } C_n^2$ , inner product of the state  $n$  minus 1 with itself, since the states are all normalized to unity. That is simply  $\text{mod } C_n^2$  because  $C_n$  is in general a complex number.

I emphasize, that  $a$  is not a Hermitian operator. Therefore it is, 1st of all this cannot represent observables, physical observables. But, linear combinations  $a$  plus  $a^\dagger$ ,  $a$  minus  $a^\dagger$  and so on represent physical observables. They are Hermitian. They represent position and momentum, for instance in this case. I have a number here which is given by  $\text{mod } C_n^2$  and on this side I know that,  $a^\dagger a$  acting on ket  $n$  is  $n$  ket  $n$  because  $\hbar\omega$ ,  $a^\dagger a$  plus half acting on ket  $n$  was  $n$  plus half  $\hbar\omega$  ket  $n$ . Therefore,  $a^\dagger a$  on ket  $n$  is  $n$  ket  $n$ . And therefore,  $\text{mod } C_n^2$  is equal to  $n$ . I can always choose my  $C_n$  to be positive and take it to be square root of  $n$ . So, now I understand what  $a$  does to ket  $n$ .

(Refer Slide Time: 30:04)

This is the equation that I have;  $a$  acts on ket  $n$  to give me root  $n$  ket  $n$  minus 1. Similarly, what does  $a$  dagger do,  $a$  dagger acts on ket  $n$  to take it to some  $C_n$  prime ket  $n$  plus 1 where,  $C_n$  prime is in general a complex number. I can always find out this object  $n$  a  $a$  dagger  $n$  but  $a a$  dagger is 1 plus  $a$  dagger  $a$ . And therefore, this object is  $n$   $n$  plus  $n$  times  $n$   $n$  which is  $n$  plus 1. So, I have  $C_n$  prime mod squared is equal to  $n$  plus 1, which implies that I can choose my  $C_n$  prime to be root of  $n$  plus one.

(Refer Slide Time: 31:35)

And therefore, I have the equation. This is 1 plus a dagger a n n and that is why I got an n plus 1 (Refer Slide Time: 30:04). This would have been an n here and a 1 there and therefore, I got an n plus 1.

So, I have a dagger on ket n is root of n plus 1, ket n plus 1 and a on ket n is root n ket n. I also have a a dagger acting on any of the states, ket n is like the identity operator acting on the state ket n, n minus 1 here. So, this is the algebra of operators that I have. In a sense, in the spin system if you recall, we could work with the algebra of: s x, s y and s z or equivalently s plus, s minus and s z. Here, I could work with x and p and the commutation between them or I could work with a and a dagger and the commutator which involves a a dagger and the identity operator.

Now, we wish to give matrix representation for these operators. As I have already pointed out, that is an infinite dimensional space. The ((Refer Time: 33:07)) the diagonal operator here, is this object and therefore diagonal elements are non 0 and they take values: 0, 1, 2, 3 and so on. So, it is pretty clear what a dagger a is in terms of matrices. 1st of all the column vectors,

(Refer Slide Time: 33:34)

I could represent ket 0 as an infinite string of numbers in the column 1 and the rest of them 0, ket 1 as: 0 1 and the rest of them 0, ket 2 as: 0 0 1 and the rest of them 0 and so on.

Analogous to the spin system where we have the two component column vectors  $\begin{pmatrix} 1 \\ 0 \end{pmatrix}$  and  $\begin{pmatrix} 0 \\ 1 \end{pmatrix}$  in the case of the 2 level atom and in the case of the 3 level atom, we had  $\begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix}$ ;  $\begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix}$  and  $\begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix}$  as the basis vectors. Now given this, a dagger a itself is an infinite matrix which has got diagonal elements: 0 1 2 3 4 and so on, all other entries being 0. I emphasize that we are working in the basis, with the basis states which are energy Eigen states, Eigen states of the Hamiltonian and the Hamiltonian is just a dagger a plus half  $\hbar$  cross omega. Now, what about a matrix representation for a and a dagger.

(Refer Slide Time: 34:54)

So, what is the m n-th element of the matrix a for instance. I know, that a on ket n is root of n ket n minus 1. Therefore,  $\langle m | a | n \rangle$  is root n  $\langle m | n-1 \rangle$ , inner product. This is just delta m n minus 1. So, it fires when m is equal to n minus 1 and is 0 otherwise. So, this would be simply replaced by the short hand notation  $a_{mn}$ . Take the matrix a, this is the m-th row and that is the n-th column. So, this is the m n-th matrix element of the matrix a.

(Refer Slide Time: 35:48)

So, it is clear that this is again an infinite dimensional matrix. And, if the rows and columns are labeled: 0 1 2 3 this way and 0 1 2 3 that way it is clear that the diagonal elements are all 0 and then I have: 0  $\sqrt{1}$  0 0 0 and so on, 0 0  $\sqrt{2}$  0 0 and so on, 0 0 0  $\sqrt{3}$  0 and so on. And, that is how I fill up the entire matrix and this is the matrix  $a$ , a dagger, you can easily follow this procedure. (Refer Slide Time: 34:54) Recall, that a dagger on ket  $n$  is  $\sqrt{n+1}$ , ket  $n+1$  and once more we can find out the matrix element.

This inner product gives us  $\delta_{m, n+1}$ , the Kronecker delta  $\delta_{m, n+1}$ . (Refer Slide Time: 35:48) But, I could well find out the Hermitian conjugate of  $a$ , that means interchange rows and columns and so on. Just interchange the rows and the columns and keep writing it so that this becomes an upper triangular matrix and that becomes, a lower triangle matrix. So, this is the diagonal out here and anything below the diagonal is 0 and above the diagonal I have entries. Just next to the diagonal, next to the principle diagonal all other elements are 0. Here, just below the principle diagonal I have entries, all other elements would be 0.

So, I can therefore fill out the various elements and I have matrix representations for the basis states  $a$ ,  $a^\dagger$  and  $a^\dagger a$ . Infinite dimensional matrices, in contrast to the finite dimensional matrices that we discussed earlier on, when we studied the 2 level atom and the 3 level atom. I did this, in order that I may look at the uncertainty product

(Refer Slide Time: 38:11)

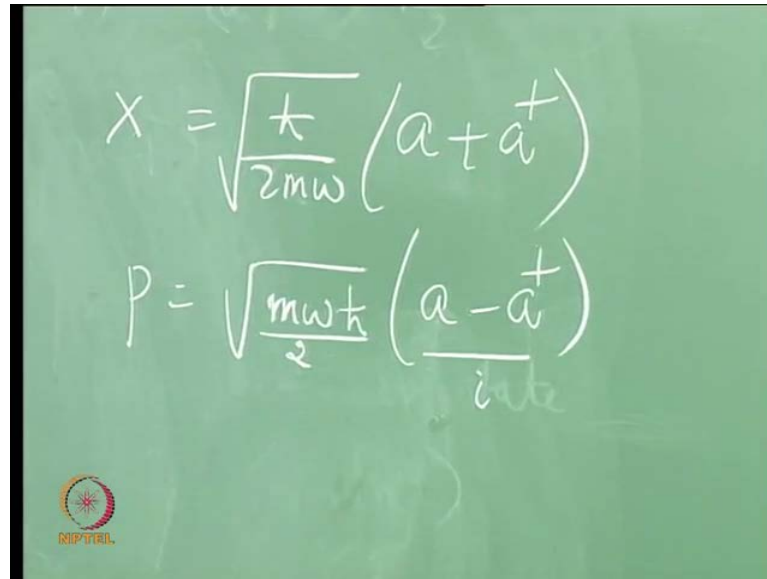

Delta x delta p in the ground state of the oscillator. All I need to do is, now calculate: expectation value  $x$  squared, expectation value  $x$ , expectation value  $p$  squared and expectation value  $p$  in this state. And then of course, I know the variance delta  $x$  squared and delta  $p$  squared. So, we can do that. Recall, that  $a$  was  $1$  by root of  $2 m \omega \hbar$  cross,  $m \omega x$  plus  $i p$  and  $a$  dagger was  $1$  by root of  $2 m \omega \hbar$  cross,  $m \omega x$  minus  $i p$  and therefore,

(Refer Slide Time: 39:11)

Root of  $2 m \omega \hbar$  cross, a plus a dagger is  $2 m \omega x$  when I add both of them. So, that tells me that  $x$  is equal to a plus a dagger root of  $2 m \omega \hbar$  cross, divided by  $2 m \omega$ . That already gives me a  $1$  by root  $2$  a plus a dagger. This multiplies root of  $\hbar$  cross by  $m \omega$ . As I pointed out earlier on: this has the dimensions of length, this is dimensionless and therefore, we get  $x$  with the correct dimensions.

(Refer Slide Time: 40:12)

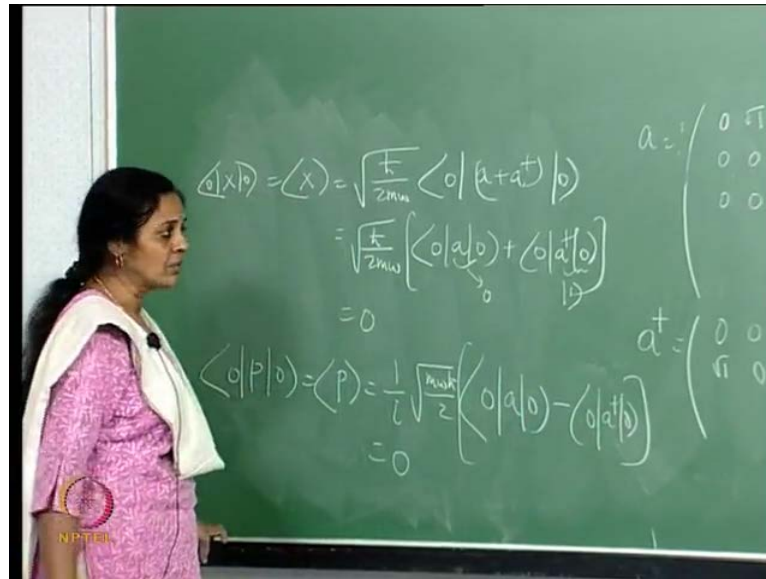

$$X = \sqrt{\frac{\hbar}{2m\omega}} (a + a^\dagger)$$

$$P = \sqrt{\frac{m\omega\hbar}{2}} (a - a^\dagger)$$

So, let me write it here.  $x$  is equal to root of  $\hbar$  cross by  $2 m \omega$ , a plus a dagger. Similarly, I can find out  $p$  by subtracting  $1$  from the other. So, root of  $2 m \omega \hbar$  cross, a minus a dagger is  $2 i p$ . I have just subtracted one from the other (Refer Slide Time: 38:11).

(Refer Slide Time: 39:11) Therefore,  $p$  is root of  $m \omega \hbar$  cross a minus a dagger by root  $2 i$ . This has dimensions of momentum and this is dimensionless. (Refer Slide Time: 40:12) So, we are through. The  $i$  is very important: it takes care of the commutation relation  $x p$  is equal to  $i \hbar$  cross. So, now all I need to do is use this to calculate the expectation values that are needed to find out the variance. So, let us do that right away.

(Refer Slide Time: 41:41)

1st of all expectation value of  $x$  in this state, my short hand notation is just that. It is root of  $\hbar$  cross by  $2 m \omega$ , expectation value of  $a$  plus  $a^\dagger$  in that state. So, that is the 1st term and this is the 2nd term. Now,  $a$  acting on  $|0\rangle$ . So this term drops out. Now,  $a^\dagger$  acting on  $|0\rangle$  is  $\sqrt{1} |1\rangle$  and because of orthonormality of the states,  $|1\rangle$  is orthogonal to  $|0\rangle$  in any case.

So, expectation value of  $x$  in the ground state of the oscillator is 0. In fact, it turns out that expectation value of  $p$  is also 0 in the ground state. We will see that right away because expectation value of  $p$ , which I will denote in this fashion, is apart from root of  $m \omega \hbar$  cross by 2. It is  $\langle 0 | a | 0 \rangle$  expectation, minus  $\langle 0 | a^\dagger | 0 \rangle$  and for the same reasons that I gave earlier this is also 0. So, I have expectation  $x$  is equal to 0 and expectation  $p$  is equal to 0 but the variance is not 0 because expectation  $x^2$  and expectation  $p^2$  are not 0. So, let us look at expectation  $x^2$ .

(Refer Slide Time: 43:33)

$$\begin{aligned}
 \langle x^2 \rangle &= \frac{\hbar}{2m\omega} \left[ \langle 0 | (a + a^\dagger)(a + a^\dagger) | 0 \rangle \right] \\
 &= \frac{\hbar}{2m\omega} \left[ \langle 0 | a^2 + a^\dagger a + a a^\dagger + a^{\dagger 2} | 0 \rangle \right] \\
 &= \frac{\hbar}{2m\omega} \left[ \langle 0 | a a^\dagger | 0 \rangle \right] \\
 a^\dagger | 0 \rangle &= \sqrt{1} | 1 \rangle \\
 \langle 0 | a &= \sqrt{1} \langle 1 |
 \end{aligned}$$

Expectation  $x$  squared as an  $\hbar$  cross by  $2m\omega$ , a plus a dagger the whole squared, its expectation value. I should be careful with the ordering because these are operators. That is  $\hbar$  cross by  $2m\omega$ . So, let us do this carefully term by term. The 1st term is an  $a$  squared in the product plus an  $a$  dagger  $a$  plus, an  $a$   $a$  dagger, plus a dagger squared  $0$ . Now, look at it term by term. Look at the matrix element. Look, at the expectation value of a square in this state. 1st of all  $a$  acts on  $0$  to give me  $0$ .

And therefore, that does not contribute. Let us look at a dagger  $a$ , a dagger  $a$  acting on ket  $0$  is  $0$  ket  $0$ . Simply because  $a$  on ket  $0$  is  $0$ . So, that does not contribute either. The last term, a dagger square on ket  $0$ , the 1st time you apply a dagger on ket  $0$ , you get ket  $1$ . The 2nd time gets you ket  $2$ . So, you need to find the inner product of bra  $0$  with ket  $2$  and that is  $0$ , because ket  $2$  is orthogonal to ket  $0$ . The only term that contributes is out here. Now, a dagger on ket  $0$  is root  $1$  ket  $1$ . Its Hermitian conjugate is root  $1$  bra  $1$ . Therefore, I find that expectation  $x$  square in the ground state of the oscillator is out here.

(Refer Slide Time: 45:32)

Handwritten equations on the chalkboard:

$$\langle 0 | p^2 | 0 \rangle = \langle p^2 \rangle$$

$$\langle p^2 \rangle = -\frac{m\omega\hbar}{2} \langle 0 | (a - a^\dagger)^2 | 0 \rangle$$

$$= -\frac{m\omega\hbar}{2} \langle 0 | (a^2 - a a^\dagger - a^\dagger a + a^{\dagger 2}) | 0 \rangle$$

$$= \frac{m\omega\hbar}{2} \langle 0 | a a^\dagger | 0 \rangle = \frac{m\omega\hbar}{2}$$

$$(\Delta p)^2 = \langle p^2 \rangle - \langle p \rangle_0^2 = \frac{m\omega\hbar}{2}$$

$$\Delta p = \sqrt{\frac{m\omega\hbar}{2}}$$

$$\langle x^2 \rangle = \frac{\hbar}{2m\omega}$$

$$(\Delta x)^2 = \langle x^2 \rangle - \langle x \rangle_0^2 = \frac{\hbar}{2m\omega}$$

$$\Delta x = \sqrt{\frac{\hbar}{2m\omega}}$$

It is  $\hbar$  cross by  $2 m \omega$ . So,  $\Delta x$  the whole squared is expectation  $x$  squared minus expectation  $x$  the whole squares. Now, this object was 0 and this was  $\hbar$  cross by  $2 m \omega$  or  $\Delta x$  is equal to root of  $\hbar$  cross by  $2 m \omega$ . So, there is the spread in  $x$  although the mean value is 0. There is a spread in  $x$  and that is given here. Let us look at  $\Delta p$ . So, once more I would do this calculation. I already know that expectation  $p$  was 0 in this state. We have seen that.

(Refer Slide Time: 46:32)

Handwritten equations on the chalkboard:

$$\langle p^2 \rangle = -\frac{m\omega\hbar}{2} \langle 0 | (a - a^\dagger)^2 | 0 \rangle$$

$$= -\frac{m\omega\hbar}{2} \langle 0 | a^2 + a^{\dagger 2} - a a^\dagger - a^\dagger a | 0 \rangle$$

$$= \frac{m\omega\hbar}{2} \langle 0 | a a^\dagger | 0 \rangle = \frac{m\omega\hbar}{2}$$

$$(\Delta p)^2 = \langle p^2 \rangle - \langle p \rangle_0^2 = \frac{m\omega\hbar}{2}$$

So, we need to find  $\langle p^2 \rangle$ . I would denote this simply by this average of  $p$  squared. So, I get expectation  $p$  square is equal to  $m \omega \hbar$  cross by 2. There was an  $i$  squares which was a minus 1. From here, (Refer Slide Time: 40:12) which is what I put there. And I have an  $a$  minus a dagger, which is minus  $m \omega \hbar$  cross by 2 the whole square because I am looking at  $p$  square. That is an, a square plus a dagger square minus  $a$  a dagger minus a dagger a 0.

As, I have already argued: this does not contribute, this does not contribute and that does not contribute. The only object that contributes is here. I can always put this as plus  $m \omega \hbar$  cross by 2, expectation  $a$  a dagger 0 and we just saw where that was 1. And therefore, we have this. Therefore,  $\Delta p$  squared is expectation  $p$  square minus expectation  $p$  the whole squared. This object was 0 and  $\Delta p$  squared was equal to  $m \omega \hbar$  cross by 2. So, here we are, (Refer Slide Time: 45:32)  $\Delta x$  is root of  $\hbar$  cross by 2  $m \omega$ .  $\Delta p$  is root of  $m \omega \hbar$  cross by 2. Therefore, the product  $\Delta x \Delta p$  in the ground state of the oscillator is very clear what it is.

(Refer Slide Time: 48:54)

It is a minimum uncertainty state. You would recall that the uncertainty principle told us: that  $\Delta x \Delta p$  would be greater than or equal to  $\hbar$  cross by 2. Now, here is a state, the ground state of the simple harmonic oscillator where  $\Delta x \Delta p$  is equal to  $\hbar$  cross by 2. The equality holds. What does that mean? Does it mean that  $\Delta x$  is non 0 and  $\Delta p$  is non zero? Not necessarily, yes there are states where  $\Delta x$  is non 0 and

$\Delta p$  is non 0. Therefore, you cannot simultaneously accurately measure with arbitrarily high precision both  $x$  and  $p$ . That is certainly true in this case. On the other hand, you could be in a position Eigen state. If you are in a position Eigen state, the state is an Eigen state of the position operator.

So,  $\Delta x$  is 0 which means that in that state  $\Delta p$  is infinity, so that the product is a finite non 0 quantity. Similarly, you could be in a momentum Eigen state or if the state is a momentum Eigen state then  $\Delta p$  is 0 but  $\Delta x$  would be infinite. You would not be in a position to predict the value of  $x$ .  $\Delta x$  would be infinite and  $\Delta p$  would be 0 in such a state and then the product is a finite quantity.

In the case, of the oscillator if  $n$  equals 1 and  $\omega$  equals 1, it is clear that  $\Delta x$  is equal to  $\Delta p$  in the ground state of the oscillator. It is a minimum uncertainty state. And,  $\Delta x$  is equal to  $\Delta p$  is equal to, in natural units, if  $m$  is equal to  $\omega$  equal to 1. Of course, if I set  $\hbar$  cross is equal to 1 that just gives me a root of 1 by 2 here and a root of 1 by 2 there. If  $m$  is equal to  $\omega$  is equal to 1 then  $\Delta x$  is equal to  $\Delta p$  is equal to root of  $\hbar$  cross by 2. In natural units,  $\hbar$  cross also would be set equal to 1. Then  $\Delta x$  is equal to  $\Delta p$  is equal to 1 by root 2 but as it stands, (Refer Slide Time: 45:32), this is the value of  $\Delta x$  and that is the value of  $\Delta p$  and the product is tells us it is a minimum uncertainty state.
