(Refer Slide Time: 00:32)

$$\vec{A} = A_1 \hat{e}_1 + A_2 \hat{e}_2 + A_3 \hat{e}_3 = a_1 \hat{E}_1 + a_2 \hat{E}_2 + a_3 \hat{E}_3$$

$$\vec{A} = c_1 \frac{\partial \vec{r}}{\partial u_1} + c_2 \frac{\partial \vec{r}}{\partial u_2} + c_3 \frac{\partial \vec{r}}{\partial u_3} = c_1 \vec{\alpha}_1 + c_2 \vec{\alpha}_2 + c_3 \vec{\alpha}_3$$

$$\vec{A} = c_1 \vec{\nabla} u_1 + c_2 \vec{\nabla} u_2 + c_3 \vec{\nabla} u_3 = c_1 \vec{\beta}_1 + c_2 \vec{\beta}_2 + c_3 \vec{\beta}_3$$

Arc length and Volume element

$$\vec{r} = \vec{r}(u_1, u_2, u_3)$$

$$d\vec{r} = \frac{\partial \vec{r}}{\partial u_1} du_1 + \frac{\partial \vec{r}}{\partial u_2} du_2 + \frac{\partial \vec{r}}{\partial u_3} du_3 = h_1 du_1 \hat{e}_1 + h_2 du_2 \hat{e}_2 + h_3 du_3 \hat{e}_3$$

Differential arc length  $ds$

$$ds^2 = d\vec{r} \cdot d\vec{r}$$

Now, let us try to find out the arc length and volume element in curvilinear coordinate system. Let us consider a position vector  $r$  is given as a function of  $u_1$ ,  $u_2$  and  $u_3$  coordinates in that curvilinear coordinate system. Then we can write  $d\vec{r}$  as in the first notation  $\frac{\partial \vec{r}}{\partial u_1} du_1 + \frac{\partial \vec{r}}{\partial u_2} du_2 + \frac{\partial \vec{r}}{\partial u_3} du_3$  which is nothing but  $h_1 du_1 \hat{e}_1$  unit vector plus  $h_2 du_2 \hat{e}_2$  unit vector plus  $h_3 du_3 \hat{e}_3$  unit vector.

Then the differential of arc length  $dS$  that can be determined as the arc length that is given as  $ds$  is nothing now we obtained  $ds$  square actually  $dS$  this quantity square would be  $dr \cdot dr$ .

(Refer Slide Time: 02:56)

Orthogonal curvilinear coordinate system

$$\hat{e}_1 \cdot \hat{e}_2 = 0 = \hat{e}_2 \cdot \hat{e}_3 = \hat{e}_3 \cdot \hat{e}_1$$

$$dS^2 = h_1^2 du_1^2 + h_2^2 du_2^2 + h_3^2 du_3^2$$

$$d\vec{r} = h_1 du_1 \hat{e}_1$$

Differential arc length  $ds_1 = h_1 du_1$

$$ds_2 = h_2 du_2$$

$$ds_3 = h_3 du_3$$

Volume element  $dV = \left| (h_1 du_1 \hat{e}_1) \cdot \left[ (h_2 du_2 \hat{e}_2) \times (h_3 du_3 \hat{e}_3) \right] \right|$

$$= h_1 h_2 h_3 du_1 du_2 du_3$$

$$\left| \hat{e}_1 \cdot \hat{e}_2 \times \hat{e}_3 \right| = 1$$

So, we will obtain this quantity. And if we have an orthogonal curvilinear coordinate system, we will have the dot product of a unit vector with itself being 1, and the dot product with another unit vector will be 0. This will be the expression. Therefore,  $dS$  squared can be written as  $h_1^2 du_1^2 + h_2^2 du_2^2 + h_3^2 du_3^2$  this way, although this would not hold for non-orthogonal coordinate systems.

Now, along a  $u_1$  curve  $u_2$  and  $u_3$  are constants. So, if we consider a curvilinear coordinate system where this is the  $u_1$  axis, this is the  $u_2$  axis and this is the  $u_3$  axis something like this just a simple picture. And if we have along disc if we have an orthogonal curvilinear

coordinate system, then along the curve of  $u_1$  we will have the other components that is  $u_2$  and  $u_3$  those will be constant necessarily they will be constant in a orthogonal system.

On that line  $dr$  will be given as  $h_1 du_1 e_1$ . And the differential arc length  $dS_1$  along  $u_1$  at any point  $p$  can be given as  $h_1 du_1$ , this is given as  $h_1 du_1$ . Similarly, if we go along the coordinate axis  $u_2$ , we will find that  $dS_2$  is given as  $h_2 du_2$  and  $dS_3$  along the remaining axis is  $h_3 du_3$ .

Once we have this then the volume element  $dV$  can be given as a product of these components. What kind of product gives us a volume element, it is the scalar triple product that we all know, that means, the volume element can be given as  $h_1 du_1 e_1$  unit vector dot  $h_2 du_2 e_2$  unit vector cross  $h_3 du_3 e_3$  unit vector like this, and because triple product can have a negative sign if we have a particular order and we do not want a negative sign because volume element we want a positive volume element.

So, we take the absolute value of this. And this turns out to be  $h_1 h_2 h_3 du_1 du_2 du_3$ . This happens like this, because we know that in orthogonal curvilinear coordinate system, we will always have  $e_1 \cdot e_2 \times e_3$  equals the absolute value of this will always be equal 1, because they are unit vectors.

Gradient, Divergence, and Curl

$\phi \rightarrow$  scalar function

$$\vec{A} = A_1 \hat{e}_1 + A_2 \hat{e}_2 + A_3 \hat{e}_3$$

Gradient  $\vec{\nabla} \phi = \frac{1}{h_1} \frac{\partial \phi}{\partial u_1} \hat{e}_1 + \frac{1}{h_2} \frac{\partial \phi}{\partial u_2} \hat{e}_2 + \frac{1}{h_3} \frac{\partial \phi}{\partial u_3} \hat{e}_3$

Divergence  $\vec{\nabla} \cdot \vec{A} = \frac{1}{h_1 h_2 h_3} \left[ \frac{\partial}{\partial u_1} (h_2 h_3 A_1) + \frac{\partial}{\partial u_2} (h_3 h_1 A_2) + \frac{\partial}{\partial u_3} (h_1 h_2 A_3) \right]$

Curl  $\vec{\nabla} \times \vec{A} = \frac{1}{h_1 h_2 h_3} \begin{vmatrix} h_1 \hat{e}_1 & h_2 \hat{e}_2 & h_3 \hat{e}_3 \\ \frac{\partial}{\partial u_1} & \frac{\partial}{\partial u_2} & \frac{\partial}{\partial u_3} \\ h_1 A_1 & h_2 A_2 & h_3 A_3 \end{vmatrix}$

Now, let us consider the gradient, divergence and curl in curvilinear coordinate systems. Suppose  $\phi$  is the scalar function, and  $A$  is a vector function given as  $A_1 \hat{e}_1 + A_2 \hat{e}_2 + A_3 \hat{e}_3$ , it is a vector it is a vector function of orthogonal curvilinear coordinates  $u_1, u_2$  and  $u_3$ . Then we will have for gradient of  $\phi$  that is written this way is  $\frac{1}{h_1} \frac{\partial \phi}{\partial u_1} \hat{e}_1 + \frac{1}{h_2} \frac{\partial \phi}{\partial u_2} \hat{e}_2 + \frac{1}{h_3} \frac{\partial \phi}{\partial u_3} \hat{e}_3$  unit vector plus  $\frac{1}{h_2} \frac{\partial \phi}{\partial u_2} \hat{e}_2$  unit vector plus  $\frac{1}{h_3} \frac{\partial \phi}{\partial u_3} \hat{e}_3$  unit vector.

For divergence of the vector function  $A$ , we will have this would be given as  $\frac{1}{h_1 h_2 h_3} \left[ \frac{\partial}{\partial u_1} (h_2 h_3 A_1) + \frac{\partial}{\partial u_2} (h_3 h_1 A_2) + \frac{\partial}{\partial u_3} (h_1 h_2 A_3) \right]$ . And finally, for curl of the vector function  $A$ , it is given as  $\frac{1}{h_1 h_2 h_3}$  the determinant of  $h_1 \hat{e}_1, h_2 \hat{e}_2, h_3 \hat{e}_3$  unit vector  $h_1 \hat{e}_1, h_2 \hat{e}_2, h_3 \hat{e}_3$  unit vector  $h_1 \hat{e}_1, h_2 \hat{e}_2, h_3 \hat{e}_3$  unit vector  $\frac{\partial}{\partial u_1}, \frac{\partial}{\partial u_2}, \frac{\partial}{\partial u_3}$   $h_1 A_1, h_2 A_2, h_3 A_3$  this determinant, this gives the curl.

The image shows a handwritten derivation of the Laplacian operator in orthogonal coordinates. The word "Laplacian" is written at the top left. The equation is:

$$\nabla^2 \phi = \frac{1}{h_1 h_2 h_3} \left[ \frac{\partial}{\partial u_1} \left( \frac{h_2 h_3}{h_1} \frac{\partial \phi}{\partial u_1} \right) + \frac{\partial}{\partial u_2} \left( \frac{h_3 h_1}{h_2} \frac{\partial \phi}{\partial u_2} \right) + \frac{\partial}{\partial u_3} \left( \frac{h_1 h_2}{h_3} \frac{\partial \phi}{\partial u_3} \right) \right]$$

The equation is written on a blue-lined background. In the bottom right corner, there is a small circular logo with the text "NPTEL" below it.

Let us also write down the expression for the Laplacian. Laplacian of a scalar function that is del squared of phi can be given as 1 over h 1 h 2 h 3 del del u 1 of h 2 h 3 over h 1 del phi del u 1 plus del del u 2 h 3 h 1 over h 2 del phi del u 2 plus del del u 3 h 1 h 2 over h 3 del phi del u 3 like this.
