Foundations of Wavelets & Multirate Digital Signal Processing

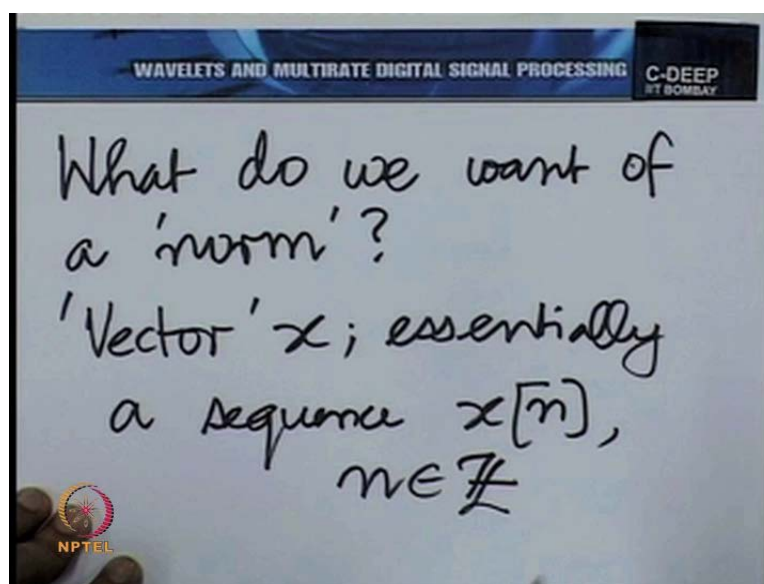

- In the last module, we saw how we can represent signals using vectors.
- Next we will learn the concept of inner product and norm along with their properties and extending it to uncountable infinite dimensional signals.

NPTEL

Prof. Vikram M. Gadre, Department of Electrical Engineering, IIT Bombay

The following things that we demand of this concept of norm or magnitude.

(Refer Slide Time: 00:40)

WAVELETS AND MULTIRATE DIGITAL SIGNAL PROCESSING C-DEEP IIT BOMBAY

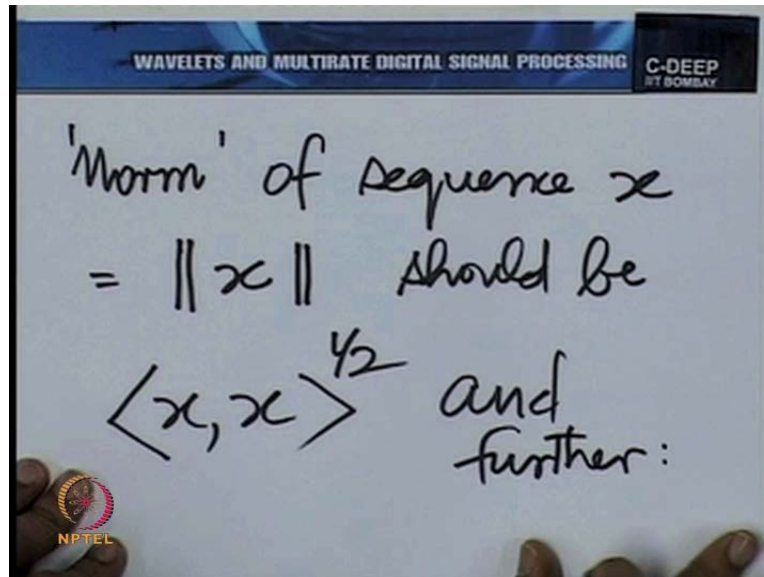

What do we want of a 'norm'?

'Vector' x ; essentially a sequence $x[n]$, $n \in \mathbb{Z}$

NPTEL

Let us write them down. This is a useful and a powerful idea to have around us. So what to want of a norm? So if I have a vector x essentially a sequence x_n . N over the set of integers then it's a norm which we shall denote in a following way.

(Refer Slide Time: 01:21)

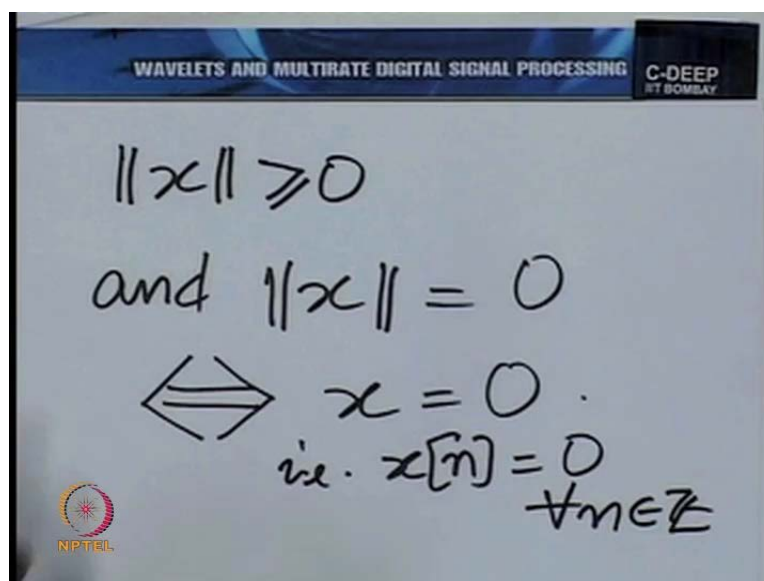

WAVELETS AND MULTIRATE DIGITAL SIGNAL PROCESSING C-DEEP IIT BOMBAY

'Norm' of sequence x
 $= \|x\|$ should be
 $\langle x, x \rangle^{1/2}$ and further:

NPTEL

We will denote it like this. Should be essentially the dot product of x with x square root.

(Refer Slide Time: 02:00)

WAVELETS AND MULTIRATE DIGITAL SIGNAL PROCESSING C-DEEP IIT BOMBAY

$\|x\| \geq 0$
and $\|x\| = 0$
 $\Leftrightarrow x = 0$.
ie. $x[n] = 0 \quad \forall n \in \mathbb{Z}$

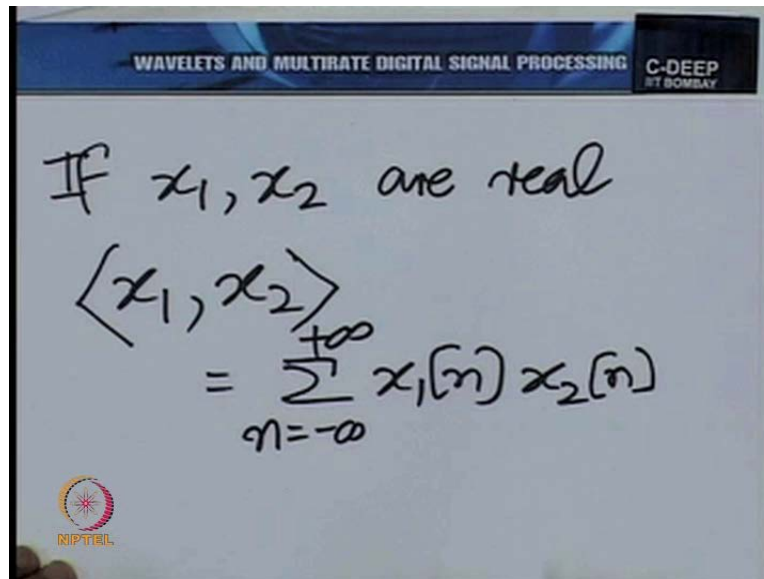

NPTEL

And further we would want norm of x to be non-negative and if at all the norm of x is 0 that implies and implied by the sequence itself being 0 everywhere that is $x[n]$ is equal to 0 for all n

belonging to set of integers. This is important. So we don't want that norm to be 0 unless the sequence itself is a 0 sequence. A non 0 sequence even if it is non 0 at one point have a non 0 norm and a 0 sequence must have a 0 norm.

Does our dot product satisfy this? Well for real sequence it does.

(Refer Slide Time: 02:40)

WAVELETS AND MULTIRATE DIGITAL SIGNAL PROCESSING C-DEEP IIT BOMBAY

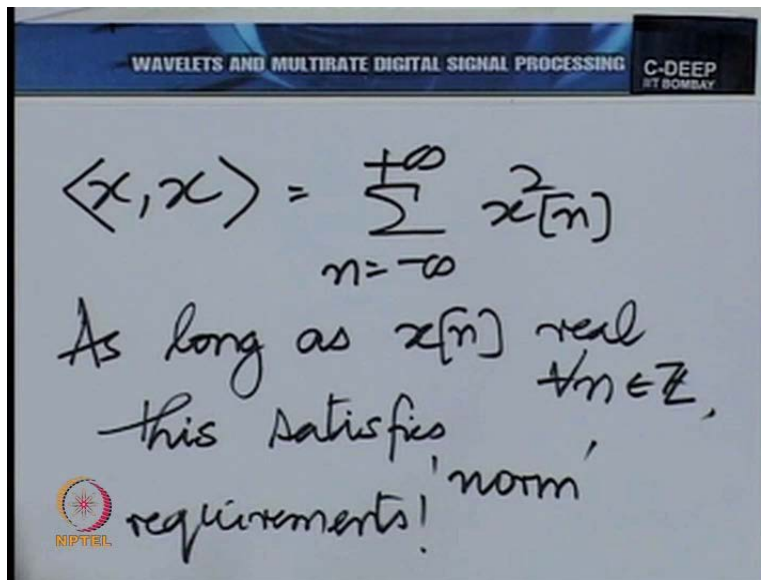

If x_1, x_2 are real

$$\langle x_1, x_2 \rangle = \sum_{n=-\infty}^{+\infty} x_1[n] x_2[n]$$

NPTEL

If x_n is real rather if x_1, x_2 are real and we take the following definition the dot product of x_1 and x_2 is essentially the summation on n going from minus to plus infinity $x_1[n], x_2[n]$.

(Refer Slide Time: 03:05)

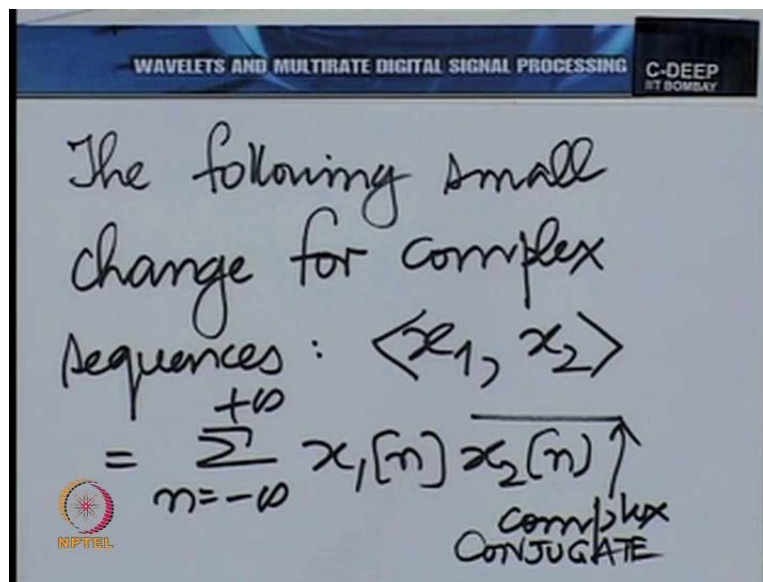

$\langle x, x \rangle = \sum_{n=-\infty}^{+\infty} x^2[n]$

As long as $x[n]$ real $\forall n \in \mathbb{Z}$,
this satisfies requirements! 'norm'

Then the dot product of x with x is essentially the summation of n running from minus to plus infinity. x square n , and as long as xn is real for all n belonging to \mathbb{Z} . This is non-negative and it is 0 if and only if the sequence is identically 0. But what if this is complex? So we have to allow complex sequences too. One of the coordinates could be complex and in fact the situation could be such that square could be plus 1 for one of the coordinates and minus 1 for some other coordinate in that case because when you square a complex number nothing guarantees the output is going to be non-negative.

In fact nothing even guarantees that the output is going to be real. Where is the question of non-negative? So this definition is not going to work when x_1 and x_2 are complex sequences in general. And we need to tweak the definition a little. Well it is not that difficult after all what we want is that for every coordinate you must get a non-negative quantity when you take point by point products. So all that we need to do for that purpose is to complex conjugate the second argument in that summation.

(Refer Slide Time: 05:05)

WAVELETS AND MULTIRATE DIGITAL SIGNAL PROCESSING C-DEEP
IT BOMBAY

The following small change for complex sequences: $\langle x_1, x_2 \rangle$

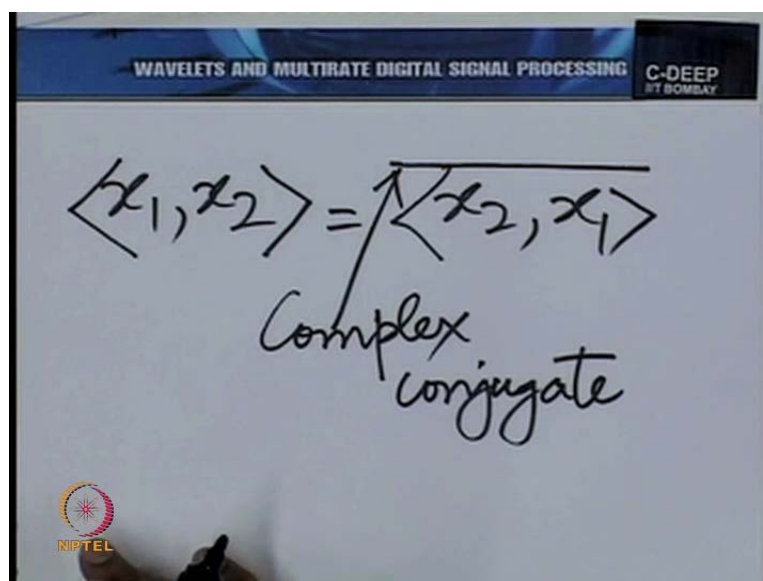

$$= \sum_{n=-\infty}^{+\infty} x_1[n] \overline{x_2[n]}$$

NPTEL

Complex CONJUGATE

So the small change for complex sequences, we'll do our job. Dot product of x_1 with x_2 is summation over all n . $x_1[n]$, $\overline{x_2[n]}$ where bar denotes the complex conjugate. Now one point to note here when we make this little change is that the commutativity property is lost.

(Refer Slide Time: 06:15)

WAVELETS AND MULTIRATE DIGITAL SIGNAL PROCESSING C-DEEP
IT BOMBAY

$$\langle x_1, x_2 \rangle = \overline{\langle x_2, x_1 \rangle}$$

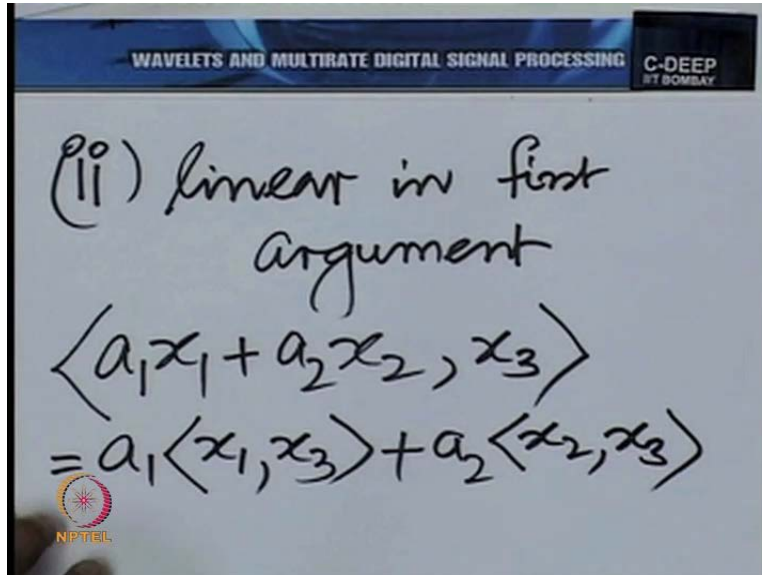

Complex conjugate

NPTEL

So if I take the inner product x_1 with x_2 and then I take inner product x_2 by x_1 there is a complex conjugate relationship. And this is a more general requirement of a dot product. In fact this is the simplest way in which one can define a dot product between sequences. There are many other ways again an infinite number of ways. But at this moment we shall not go into the other ways

they will only confuse us. This is what is called the standard inner product. But one can have many other non standard inner products which obey the following conditions.

(Refer Slide Time: 07:05)

The image shows a whiteboard with handwritten text and equations. At the top, there is a blue header with the text "WAVELETS AND MULTIRATE DIGITAL SIGNAL PROCESSING" and "C-DEEP IIT BOMBAY". The main content is written in black ink. It starts with "(ii) linear in first argument". Below this, the equation $\langle a_1 x_1 + a_2 x_2, x_3 \rangle = a_1 \langle x_1, x_3 \rangle + a_2 \langle x_2, x_3 \rangle$ is written. In the bottom left corner, there is a small logo for NPTEL.

$$\begin{aligned} & \text{(ii) linear in first argument} \\ & \langle a_1 x_1 + a_2 x_2, x_3 \rangle \\ & = a_1 \langle x_1, x_3 \rangle + a_2 \langle x_2, x_3 \rangle \end{aligned}$$

The first condition is this let me write down here. The inner product of the x_1 with x_2 is the complex conjugate of the inner product of x_2 with x_1 . Secondly the inner product is linear in the first argument. In other words if I take $a_1 x_1$ plus $a_2 x_2$ where in general a_1 and a_2 would be complex and take the inner product x_3 , it is essentially a_1 times inner product of x_1 with x_3 plus a_2 times the inner product of x_2 with x_3 . This is the second requirement of an inner product. Linearity in the first argument.

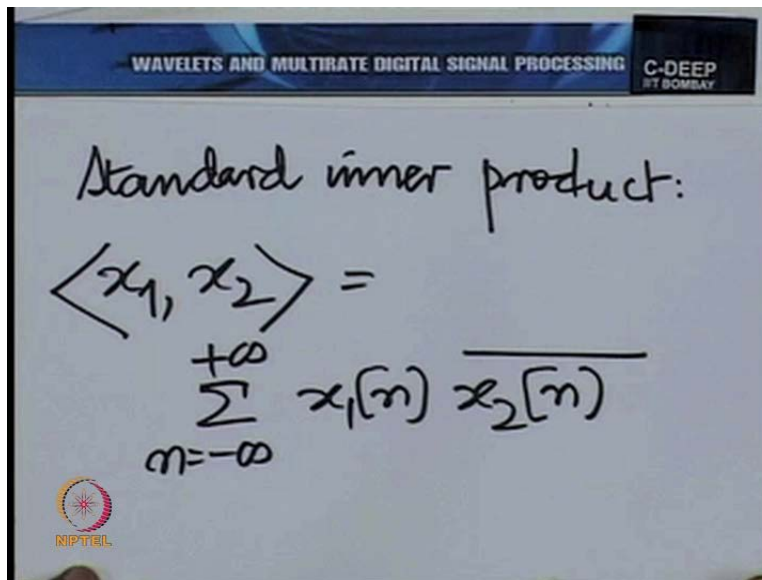

(Refer Slide Time: 08:05)

The 3rd requirement of the inner product is what we have been building towards all this while namely what is called the positivity or non-negativity. In fact positivity is more appropriate. Positive definiteness. Namely the inner product of x with x is always greater than equal to 0 and x equal to 0 implies and is implied by the inner product of x with x being 0.

In fact any operation between 2 sequences x_1 and x_2 which obeys these 3 conditions is called an inner product. And the standard inner product that we have just described is one such which we shall use very frequently. So in the discussions hence forth when we say inner product of sequences we mean the standard inner product unless otherwise specified. Alright so let us just verify this for completeness let us verify this for the standard inner product.

(Refer Slide Time: 09:30)

WAVELETS AND MULTIRATE DIGITAL SIGNAL PROCESSING C-DEEP IIT BOMBAY

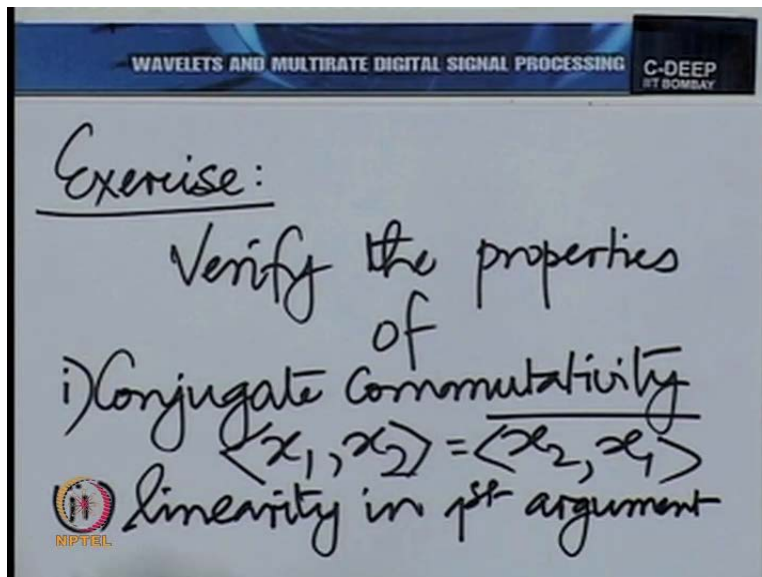

Standard inner product:

$$\langle x_1, x_2 \rangle = \sum_{n=-\infty}^{+\infty} x_1[n] \overline{x_2[n]}$$

NIPTEL

The inner product of 2 sequences x_1, x_2 is essentially the sum and going from minus to plus infinity $x_1[n], x_2[n]$ definition.

(Refer Slide Time: 10:05)

WAVELETS AND MULTIRATE DIGITAL SIGNAL PROCESSING C-DEEP IIT BOMBAY

Exercise:

Verify the properties of

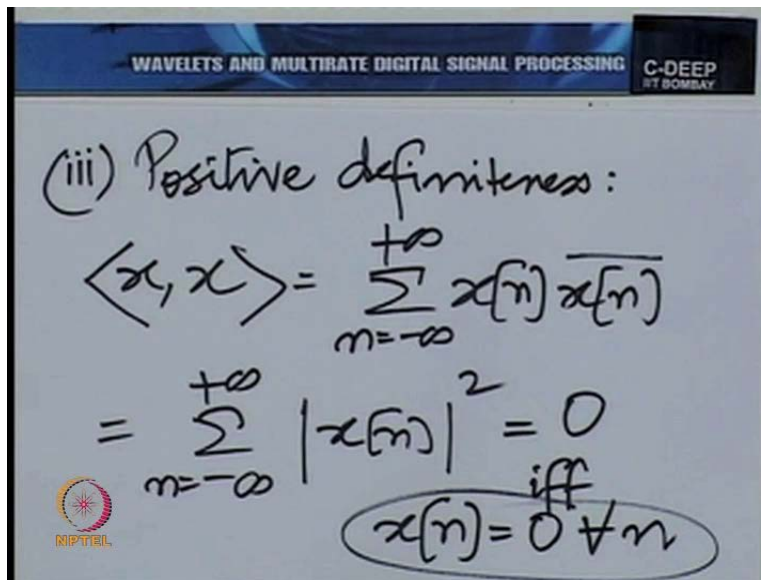

i) Conjugate Commutativity
 $\langle x_1, x_2 \rangle = \overline{\langle x_2, x_1 \rangle}$

ii) Linearity in 1st argument

NIPTEL

The first property as we said is complex conjugate easy to verify. So in fact I will leave it to you as an exercise. Verify the properties of what is called conjugate commutativity, the first property and linearity, linearity in the first argument. I will leave it as an exercise easy enough to do.

(Refer Slide Time: 11:05)

The slide shows a handwritten derivation for the positive definiteness property. It starts with the inner product $\langle x, x \rangle$ and shows it is equal to the sum of squares of the sequence values, which is zero only if the sequence is identically zero.

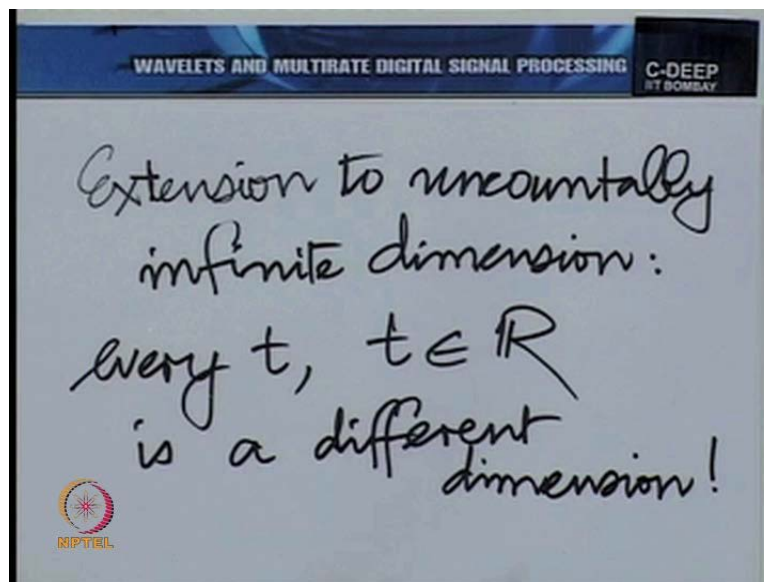

$$\begin{aligned} \text{(iii) Positive definiteness:} \\ \langle x, x \rangle &= \sum_{n=-\infty}^{+\infty} x[n] \overline{x[n]} \\ &= \sum_{n=-\infty}^{+\infty} |x[n]|^2 = 0 \\ &\quad \text{iff } x[n] = 0 \forall n \end{aligned}$$

But we shall because it is so important verify the third property the positive definiteness. Indeed if we take the dot product of x with x it is summation n going from minus to plus infinity, $x[n]$, $x[n]$ bar which is summation n going from minus to plus infinity mode $x[n]$ square. And it is very easy to see that this is equal to 0 if and only if $x[n]$ equal to 0 for all n . Even if one of the coordinates is non 0 that particular mode $x[n]$ square is going to be non 0 and it is going to contribute a positive term.

And of course it is very easy to see that each term for every n I mean is strictly positive if $x[n]$ is non 0. So far so good. So now we have built up the idea of inner product or dot product between two sequences which is going to be useful to us. So we have moved from 2 dimensional to 3 dimensional to n dimensional, n is infinite and to countably finite dimension. Now let us move to uncountably infinite dimension.

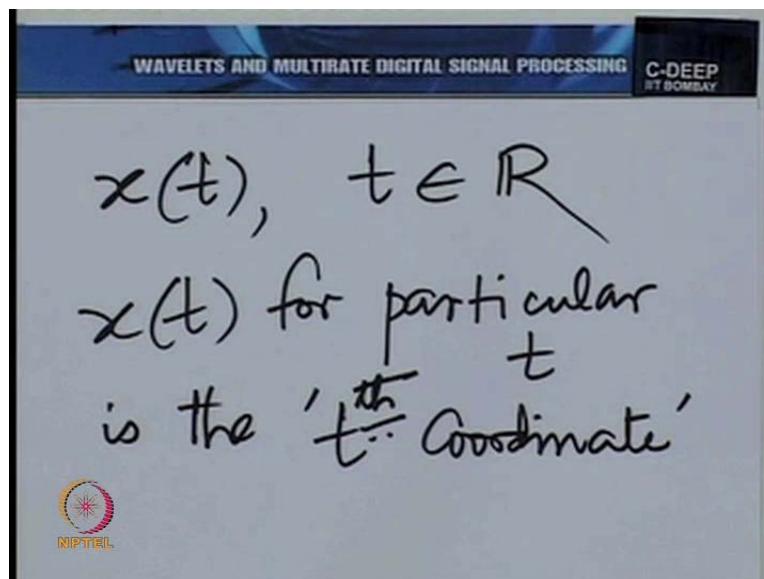

So suppose I take a function of the continuous variable t how can I extend these notions.

(Refer Slide Time: 12:45)

So extension to uncountably infinite dimension. Well this is going to be very difficult in general but very easy in particular if we simply accept that every t for real t is a different dimension.

(Refer Slide Time: 13:25)

Simple so if you have a function x of t , t over the real numbers. x of t for a particular t is the t th coordinate so to speak and there is uncountably infinite number of such coordinates indexed by the real numbers.

So in principle in a given function you have complete liberty to put down the value of x_t at every different point t . The only catch is we have agreed that we would like to make the functions square integrable. So that does put some restriction on x_t but not a very serious one even so. Now you know dealing with infinite dimensional spaces if we wish to do it very rigorously and very very carefully and to satisfy the fastidious mathematician is a difficult job.

And we don't really intend to do that all the way in this course. If some of us do wish to take that puritanical perspective then of course would benefit from it in some ways and one could look up a book on functional analysis but what we wish to do is rather to give intuitive understanding of some of the concepts at different places. The intuitive understanding will not be different from a more rigorous understanding for those specific situations.

But it may not quite be complete. Even so we would not suffer too much in our study of wavelets, in our applications of wavelengths if we take this intuitive path to some extent not all the time. I mean to some extent in the context of dealing with infinite dimensional spaces.
