Next is Newton-Raphson method: considerily have seen now say Newton-Raphson method in sort inner method right. So, Newton-Raphson method also is an iterative method in your in your mathematics course you have studied Newton-Raphson method right solving that you know what to call different problems right.

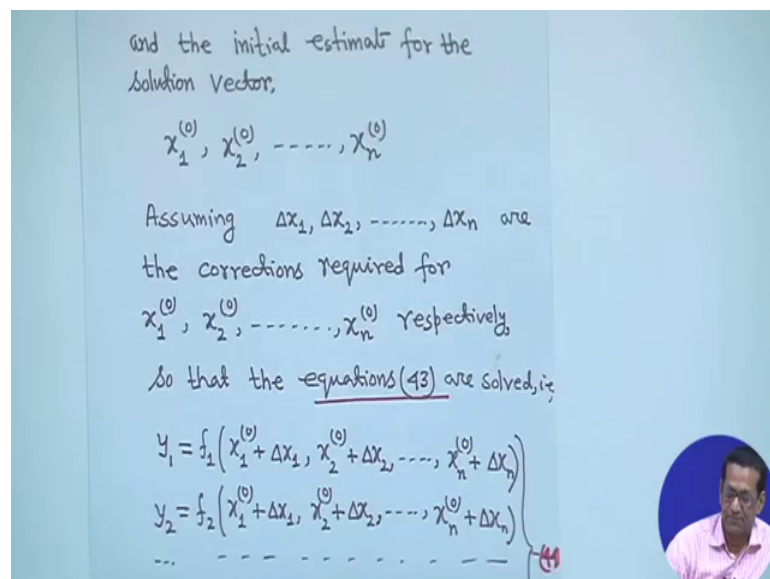

So, which approximates the set of non-linear simultaneous equations to a set of linear equations right using Taylor's series expansion and the terms are restricted to first order approximation we will only consider up to the Taylor's series expansion only the first order terms right will not go for second or higher order right. So, for example, you take given a set of non-linear equations.

(Refer Slide Time: 01:01)

So, suppose it is given  $y_1$  is equal to  $f_1$  function of  $x_1, x_2$  up to  $x_n$  similarly  $y_2$  is equal to  $f_2$  of  $x_1, x_2$  up to  $x_n$ . Similarly up to  $y_n$  is equal to  $f_n$  of  $x_1, x_2$  up to  $x_n$  you take a set of non-linear equation say this is equation 43 first we will see that iterative process then we will go for load flow right. So, this is your non-linear equation. Now just hold on.

(Refer Slide Time: 01:42)

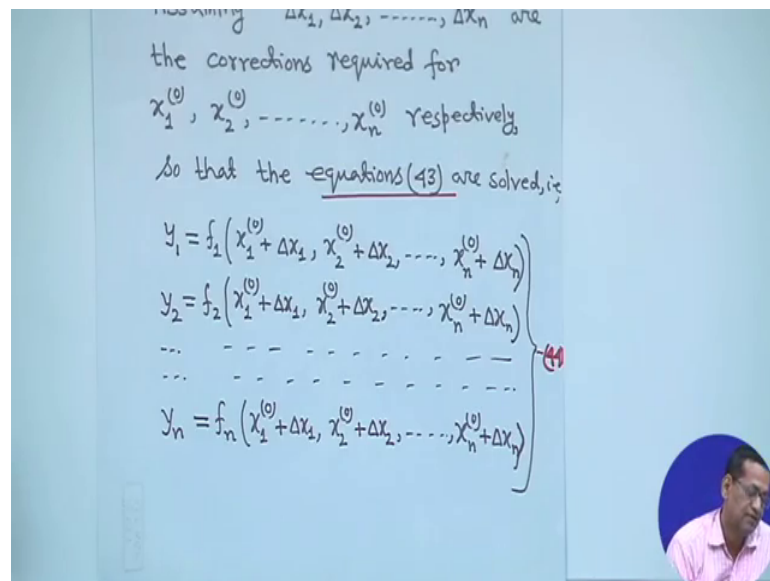

Now, suppose the initial estimates for the solution vector is given these are the initial values given  $x_{10}, x_{20}$  up to  $x_{n0}$  for all  $x$  values initial values are given right. Now

what to do assuming  $\Delta x_1, \Delta x_2, \dots, \Delta x_n$  right are the corrections required for  $x_1, x_2, \dots, x_n$  right respectively every iteration you need to update the  $x$  value.

So, these are the correction required  $\Delta x_1, \Delta x_2, \Delta x_n$  right. So, so that the equation 43; that means, previous equation; that means, these equations; this equation; equation 43; this equation right.

(Refer Slide Time: 02:22)

You can make it like this that  $y_1$  is equal to  $f_1$  it is  $x_1$  plus  $\Delta x_1$  comma  $x_2$  plus  $\Delta x_2$  comma up to  $x_n$  plus  $\Delta x_n$  right because every  $a$  you have to update this one right.

Similarly,  $y_2$  is equal to  $f_2$   $x_1$  plus  $\Delta x_1$   $x_2$  plus  $\Delta x_2$  up to  $x_n$  plus  $\Delta x_n$  for  $y_n$   $f_n$  that  $x_1$  plus  $\Delta x_1$   $x_2$  plus  $\Delta x_2$   $x_n$  plus  $\Delta x_n$  this is equation 44 right. Now this equation when you put like this; this equation you have to expand in Taylor series right and we will consider only the first your first order first order this thing your second order had derivatives will not consider right.

(Refer Slide Time: 03:05)

(67)

Each equation of the set (44) can be expanded by Taylor's Series for a function of two or more variables.

For example, the following is obtained for the first equation of (44):

$$y_1 = f_1(x_1^{(0)} + \Delta x_1, x_2^{(0)} + \Delta x_2, \dots, x_n^{(0)} + \Delta x_n)$$

$$= f_1(x_1^{(0)}, x_2^{(0)}, \dots, x_n^{(0)}) + \Delta x_1 \left. \frac{\partial f_1}{\partial x_1} \right|_0 + \Delta x_2 \left. \frac{\partial f_1}{\partial x_2} \right|_0 + \dots + \Delta x_n \left. \frac{\partial f_1}{\partial x_n} \right|_0 + \psi_1$$

Where  $\psi_1$  is a function of  $\Delta x_1, \Delta x_2, \dots, \Delta x_n$ .

So, the equation the equation of the set 44 because you have n number non-linear equation can be expanded by Taylor's series for a function of 2 or more variable right for example, the following is obtained of the first equation of 44 I mean if you take that first equation; that means, this one if just first equation you take which is set of non-linear equation right.

Consider only the 44 let me this one sorry this one this first equation of the 44 this is 44 first equation of this one right. So, if you do. So, so then you can write this  $y_1$  is equal to  $f_1(x_1^{(0)} + \Delta x_1, x_2^{(0)} + \Delta x_2, \dots, x_n^{(0)} + \Delta x_n)$  right. So, you expand it in Taylor series.

So, it will become  $f_1(x_1^{(0)}, x_2^{(0)}, \dots, x_n^{(0)}) + \Delta x_1 \left. \frac{\partial f_1}{\partial x_1} \right|_0 + \Delta x_2 \left. \frac{\partial f_1}{\partial x_2} \right|_0 + \dots + \Delta x_n \left. \frac{\partial f_1}{\partial x_n} \right|_0 + \psi_1$  put that whatever the I mean the here you have to take the derivative and put the all the initial value that is why one you are what to call the suffix 0 0 is shown here right that mean  $\left. \frac{\partial f_1}{\partial x_1} \right|_0$  whatever it comes you have to put that values x values right.

Similarly, plus  $\Delta x_2 \left. \frac{\partial f_1}{\partial x_2} \right|_0$  same thing up to  $\Delta x_n \left. \frac{\partial f_1}{\partial x_n} \right|_0$  plus  $\psi_1$   $\psi_1$  is the higher order terms will not consider right.

(Refer Slide Time: 04:25)

for the first equation of (44):

$$y_1 = f_1(x_1^{(0)} + \Delta x_1, x_2^{(0)} + \Delta x_2, \dots, x_n^{(0)} + \Delta x_n)$$

$$= f_1(x_1^{(0)}, x_2^{(0)}, \dots, x_n^{(0)}) + \Delta x_1 \left. \frac{\partial f_1}{\partial x_1} \right|_0 + \Delta x_2 \left. \frac{\partial f_1}{\partial x_2} \right|_0 + \dots + \Delta x_n \left. \frac{\partial f_1}{\partial x_n} \right|_0 + \psi_1$$

Where  $\psi_1$  is a function of higher powers of  $\Delta x_1, \Delta x_2, \dots, \Delta x_n$  and 2nd, 3rd, ..... derivatives of the function  $f_1$ .

Where  $\psi_1$  is a function of higher power of  $\Delta x_1, \Delta x_2$  and  $\Delta x_n$  and second third derivatives of the function  $f_1$  and will not consider that we will take only up to this right only this term. So, this we first we expand in Taylor series right.

(Refer Slide Time: 04:52)

(48)

neglecting  $\psi_1$ , the linear set of equations resulting is as follows:

$$\begin{cases} y_1 = f_1(x_1^{(0)}, x_2^{(0)}, \dots, x_n^{(0)}) + \Delta x_1 \left. \frac{\partial f_1}{\partial x_1} \right|_0 + \dots + \Delta x_n \left. \frac{\partial f_1}{\partial x_n} \right|_0 \\ y_2 = f_2(x_1^{(0)}, x_2^{(0)}, \dots, x_n^{(0)}) + \Delta x_1 \left. \frac{\partial f_2}{\partial x_1} \right|_0 + \dots + \Delta x_n \left. \frac{\partial f_2}{\partial x_n} \right|_0 \\ \dots \\ y_n = f_n(x_1^{(0)}, x_2^{(0)}, \dots, x_n^{(0)}) + \Delta x_1 \left. \frac{\partial f_n}{\partial x_1} \right|_0 + \dots + \Delta x_n \left. \frac{\partial f_n}{\partial x_n} \right|_0 \end{cases} \quad (45)$$

$$\begin{bmatrix} y_1 - f_1(x_1^{(0)}, x_2^{(0)}, \dots, x_n^{(0)}) \\ y_2 - f_2(x_1^{(0)}, x_2^{(0)}, \dots, x_n^{(0)}) \\ \dots \\ y_n - f_n(x_1^{(0)}, x_2^{(0)}, \dots, x_n^{(0)}) \end{bmatrix} = \begin{bmatrix} \left. \frac{\partial f_1}{\partial x_1} \right|_0 & \left. \frac{\partial f_1}{\partial x_2} \right|_0 & \dots & \left. \frac{\partial f_1}{\partial x_n} \right|_0 \\ \left. \frac{\partial f_2}{\partial x_1} \right|_0 & \left. \frac{\partial f_2}{\partial x_2} \right|_0 & \dots & \left. \frac{\partial f_2}{\partial x_n} \right|_0 \\ \dots & \dots & \dots & \dots \\ \left. \frac{\partial f_n}{\partial x_1} \right|_0 & \left. \frac{\partial f_n}{\partial x_2} \right|_0 & \dots & \left. \frac{\partial f_n}{\partial x_n} \right|_0 \end{bmatrix} \begin{bmatrix} \Delta x_1 \\ \Delta x_2 \\ \dots \\ \Delta x_n \end{bmatrix}$$

So, next is I will I will rotate this one. So, neglect neglecting  $\psi_1$  the linear set of equations resulting is as follows. So, I will rotate this right. So,  $y$ ; that means,  $y_1$  is equal to you can write  $f_1(x_1^{(0)}, x_2^{(0)}, \dots, x_n^{(0)}) + \Delta x_1 \left. \frac{\partial f_1}{\partial x_1} \right|_0 + \Delta x_2 \left. \frac{\partial f_1}{\partial x_2} \right|_0 + \dots + \Delta x_n \left. \frac{\partial f_1}{\partial x_n} \right|_0$  this all this values actually  $\left. \frac{\partial f_1}{\partial x_1} \right|_0$

we have to substitute the value of initial values and evaluate that is why these are these were these were shown right.

So, similarly  $y_2$  is equal to same thing  $f_2(x_1, x_2, \dots, x_n)$  up to  $x_{n0}$  plus  $\Delta x_1$  del  $f_2$  upon del  $x_1$  up to del  $x_n$  upon del  $f_2$  x  $n$  right. So, similarly that  $y_n$  is equal to  $f_n(x_1, x_2, \dots, x_n)$  up to  $x_{n0}$  plus  $\Delta x_1$  del  $f_n$  upon del  $x_1$  up to dot dot dot up to plus  $\Delta x_n$  del  $f_n$  upon del  $x_n$  this is equation 45 right. Now you can write  $y_1 - f_1$  is equal to this  $y_2 - f_2$  is equal to this  $y_n - f_n$  is equal to this 1.

(Refer Slide Time: 05:57)

Neglecting  $y_i$ , the linear equations resulting is as follows

$$y_n = f_n(x_1^{(0)}, x_2^{(0)}, \dots, x_n^{(0)}) + \Delta x_1 \frac{\partial f_n}{\partial x_1} \Big|_0 + \dots + \Delta x_n \frac{\partial f_n}{\partial x_n} \Big|_0$$

$$\begin{bmatrix} y_1 - f_1(x_1^{(0)}, x_2^{(0)}, \dots, x_n^{(0)}) \\ y_2 - f_2(x_1^{(0)}, x_2^{(0)}, \dots, x_n^{(0)}) \\ \vdots \\ y_n - f_n(x_1^{(0)}, x_2^{(0)}, \dots, x_n^{(0)}) \end{bmatrix} = \begin{bmatrix} \frac{\partial f_1}{\partial x_1} \Big|_0 & \frac{\partial f_1}{\partial x_2} \Big|_0 & \dots & \frac{\partial f_1}{\partial x_n} \Big|_0 \\ \frac{\partial f_2}{\partial x_1} \Big|_0 & \frac{\partial f_2}{\partial x_2} \Big|_0 & \dots & \frac{\partial f_2}{\partial x_n} \Big|_0 \\ \vdots & \vdots & \ddots & \vdots \\ \frac{\partial f_n}{\partial x_1} \Big|_0 & \frac{\partial f_n}{\partial x_2} \Big|_0 & \dots & \frac{\partial f_n}{\partial x_n} \Big|_0 \end{bmatrix} \begin{bmatrix} \Delta x_1 \\ \Delta x_2 \\ \vdots \\ \Delta x_n \end{bmatrix}$$

$\Downarrow$   $\Downarrow$

--- (46)

So, same thing we are writing here that  $y_1 - f_1(x_1, x_2, \dots, x_n)$  up to  $x_{n0}$  then  $y_2 - f_2(x_1, x_2, \dots, x_n)$  the function of all the initial values  $f_2$  then  $y_n - f_n(x_1, x_2, \dots, x_n)$  up to  $x_{n0}$  is equal to this is equal to this from here this side this side right. So, it is del  $f_1$  upon del  $x_1$ , but all these things again and again noted understandable that after take the derivative at put that values right initial values right.

Del  $f_2$  upon del  $f_1$  upon del  $x_2$ . So, all the every iteration actually these matters will change right. So, anyway up to del  $f_1$  upon del  $x_n$  and similarly del  $f_2$  upon del  $x_1$  del  $f_2$  upon del  $x_2$  del  $f_2$  upon del  $x_n$  del  $x_n$  here it is del  $f_n$  upon del  $x_1$  del  $f_n$  upon del  $x_2$  del  $f_n$  upon del  $x_n$  the  $\Delta x_1 \Delta x_2$  up to  $\Delta x_n$  right this equation is 46.

This one this mismatch this one let us define as a  $D$  right and this one this one you define as a  $J$  right. So,  $J$  actually is called the Jacobean for the function  $f_i$  right.

(Refer Slide Time: 07:11)

or,  
 $D = J R \dots (47)$

Where  $J$  is the Jacobian for the functions  $f_i$ , and  $R$  is the change Vector  $\Delta x_i$ .

Eqn. (47) may be written in iterative form, i.e.,

$$D^{(p)} = J^{(p)} R^{(p)}$$
$$\therefore R^{(p)} = [J^{(p)}]^{-1} D^{(p)} \dots (48)$$

The new values for  $x_i$ 's are

Therefore this equation if it is D if it is D and this is J and this residual vector delta x 1 delta x 2 this can be called as capital R right.

Delta x 1 delta x 2 delta x n this can you call a capital R right; that means, D is equal to your can be written as J R right if this is D this is J and this vector if it is R not shown here, but I am telling you can hear it delta x 1 this one be R then this one equation can be written as D is equal to R R this is equation 47 equation 47 right where J is the Jacobean for the function  $f_i$  and R is the change vector that is delta xi right.

(Refer Slide Time: 07:59)

Vector  $\Delta x_i$ .

Eqn. (47) may be written in iterative form, i.e.,

$$D^{(p)} = J^{(p)} R^{(p)}$$
$$\therefore R^{(p)} = [J^{(p)}]^{-1} D^{(p)} \dots (48)$$

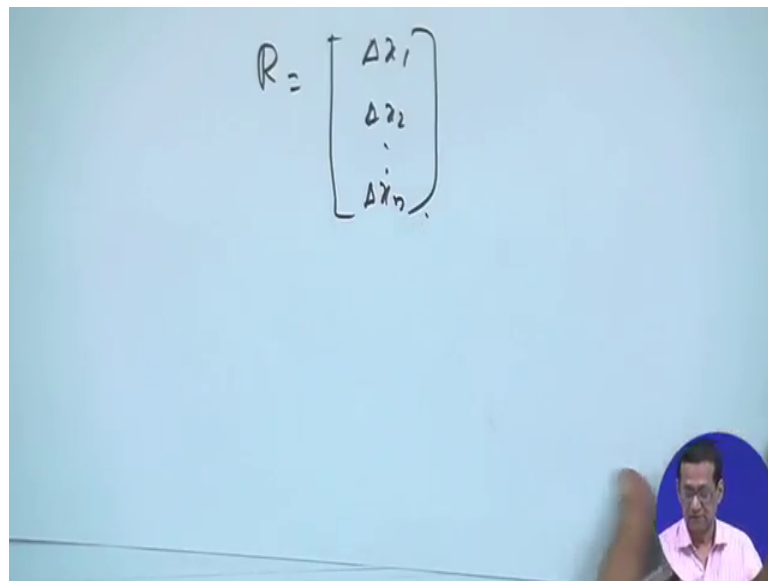

The new values for  $x_i$ 's are calculated from

$$x_i^{(p+1)} = x_i^{(p)} + \Delta x_i^{(p)} \dots (49)$$

So, equation 47 maybe written in iterative form that is suppose any iteration count your  $p$  then  $D_p$  is equal to  $J_p$  into  $r_p$   $p$  is the iteration count right so; that means,  $R_p$  will be is equal to  $J_p$  inverse into  $D_p$  right this is equation 48 right. So, the new value of  $x_i$  s are calculated from at I mean the  $x_i^{p+1}$  is equal to  $x_i^p$  plus  $\Delta x_i^p$  where  $R_p$  is the vector  $\Delta x_1 \Delta x_2 \Delta x_3$  up to  $\Delta x_n$ .

So, all if you know this one if you know this one that all  $\Delta x$  can be computed right this one can be computed. So, this is  $R_p$  is that your this thing actually  $R$  is like this right.

(Refer Slide Time: 08:42)

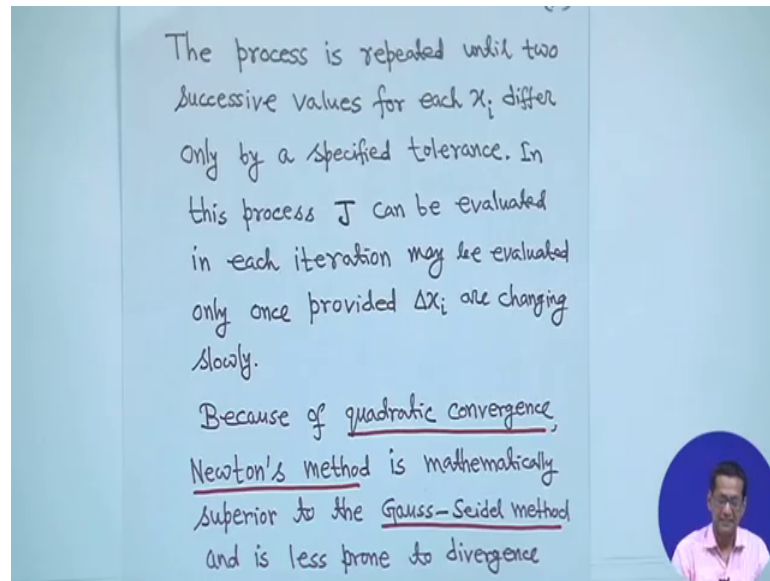

$$R = \begin{bmatrix} \Delta x_1 \\ \Delta x_2 \\ \vdots \\ \Delta x_n \end{bmatrix}$$

$R$  is like this  $\Delta x_1 \Delta x_2$  this one right. So, all the  $\Delta x$  value can be computed from equation 48 right.

Therefore this  $x$  can be updated  $x_i^{p+1}$  is equal to  $x_i^p$  and from here you will get all  $\Delta x$  values for  $\Delta x_i^p$  this is equation 49 right. So, the process is repeated until 2 successive values for each  $x_i$  differ only by specified tolerance because you have to go for you have to go for convergence characteristic right.

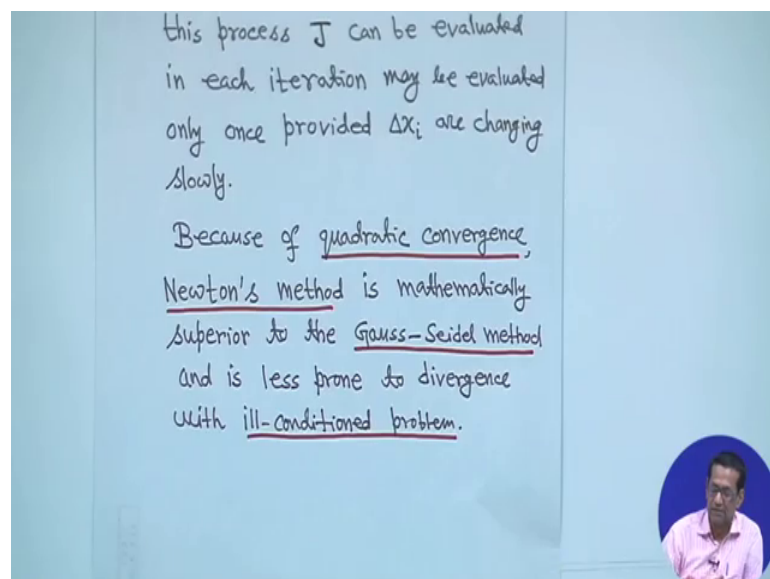

(Refer Slide Time: 09:18)

So, same way later we will see for Newton-Raphson method and you have to see that solves  $\sin x$  convex right. So, in this process  $J$  can be evaluated in each iteration maybe may be evaluated only ones provided  $\Delta x_i$  changing slowly if changing  $\Delta x$  is very small then changing the value of  $x$  will very small. So,  $\Delta J$  Jacobean matrix  $J$  instead of evaluating every iteration very fast iteration you compute after that written it constant throughout the iterative process right.

(Refer Slide Time: 10:00)

So, because of quadratic convergence Newton's method is mathematically superior to the Gauss Seidel method. So, Newton-Raphson method is much superior than Gauss Seidel method and is less prone to divergence with ill conditioned problem. So, if network is ill condition then there the; what you call then Gauss Seidel may fail to converge right. So, what is ill conditioning later will see first let us discuss about your; what you call that Newton-Raphson method right.

So next, that load flow using Newton-Raphson method. So, what will little bit of mathematics you saw that is your this thing now load flow using your Newton-Raphson method right.

(Refer Slide Time: 10:42)

Load Flow Using Newton-Raphson Method.

Newton-Raphson (N-R) method is more efficient and practical for large power systems. Main advantage of this method is that the number of iterations required to obtain a solution is independent of the size of the problem and computationally it is very fast. Here load flow problem is formulated in polar form. Rewriting eqns (5) and (4)

$$\rightarrow P_i = \sum_{k=1}^n |V_i||V_k||Y_{ik}| \cos(\theta_{ik} - \delta_i + \delta_k) \dots (50)$$

$$\rightarrow Q_i = -\sum_{k=1}^n |V_i||V_k||Y_{ik}| \sin(\theta_{ik} - \delta_i + \delta_k) \dots (51)$$

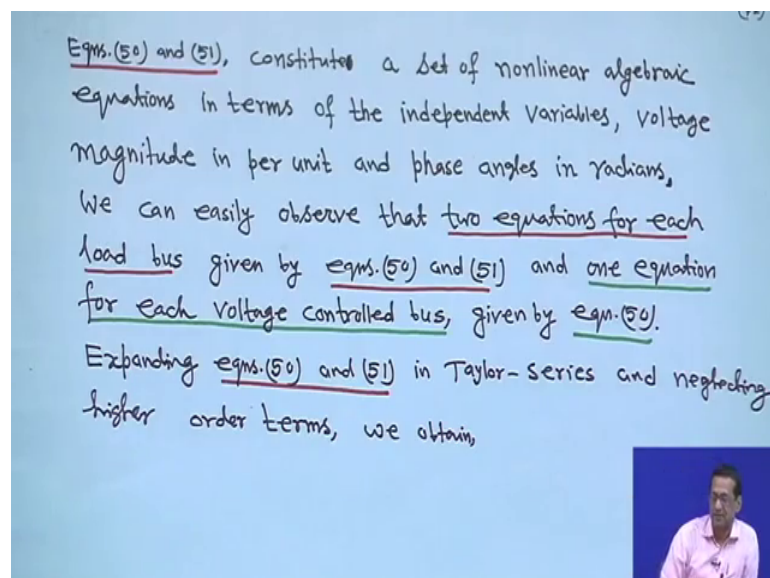

So, in this case you are what you call more efficient and practical for large power systems right main advantage of this method is that the number of iterations required to obtain a solution is independent of the size of the your problem and computationally it is very fast.

So, basically what happen for Newton-Raphson method that generally you will find it takes hardly 3 to 4 iterations to converge even 2 to 3 iterations it converge right whatever maybe the dimension of the problem dimension of the problem means that number of bus suppose it consider 500 or 1000 bus per problem right. So, you will find numbers of iterations more or less are independent right.

So, we have what we are doing is now that rewriting equation 15 and 16 same equation we are rewriting, but numbering again 50 and 51 here right. So,  $P_i$  is equal to the power that your injected power and bus  $i$  earlier we have derived this  $k$  is equal to  $1$  to  $n$   $V_i V_k \cos(\theta_i - \theta_k)$ . So, hence will not alter magnitude because these are all magnitude bar it is there cosine  $\theta_i - \theta_k$ .

So, and  $Q_i$  is equal to  $-\sum_{k=1}^n V_i V_k \sin(\theta_i - \theta_k)$  this is equation 51 right. So, it is a set of your; what you call non-linear equations and but here also you have to consider  $p$  bus sorry  $p$  bus and  $PV$  bus right so equation 50 and 51; that means, these 2 equations right that constitute a set of non-linear algebraic equations in terms of independent variables.

(Refer Slide Time: 12:21).

So, voltage magnitude in per unit and phase angles in radians right. So, we can easily observe that 2 equations for each load bus is given by equation 50 and 51; that means, there are 2 equations for each load bus given  $P_i$  and  $Q_i$  for equation 50 and 51 right. So, and one equation for each voltage control bus given equation 50 and if it is a  $PV$  bus your voltage magnitude will remain constant right. So, at that time  $P_i$  is known so one equation right given by equation 50.

So, you have to now expand equation 50 and 51 in Taylor series and neglect higher term; that means, this equations right because all these things right we have to we have to solve iteratively. So, there and these are the non-linear equation just now we saw that non-

linear equation how to expand in Taylor series. So,  $p_i$  and  $q_i$  we have to expand in Taylor series and you have to see that how things are happening right.

So, in this case what will happen for this case also will assume that bus one is a slack bus. So, will see  $i$  is equal to 2 to  $n$  right bus 1 is a slack bus. So, in that case what will happen that if you expand this thing and neglect higher terms in Taylor series then you are mathematical thing will be something like this right.

(Refer Slide Time: 13:49)

$$\begin{aligned}
 \begin{matrix} \Delta P_2^{(p)} \\ \Delta P_3^{(p)} \\ \vdots \\ \Delta P_n^{(p)} \end{matrix} &= \begin{matrix} \left( \frac{\partial P_2}{\partial \delta_2} \right)^{(p)} & \left( \frac{\partial P_2}{\partial \delta_3} \right)^{(p)} & \dots & \left( \frac{\partial P_2}{\partial \delta_n} \right)^{(p)} & \left( \frac{\partial P_2}{\partial V_2} \right)^{(p)} & \left( \frac{\partial P_2}{\partial V_3} \right)^{(p)} & \dots & \left( \frac{\partial P_2}{\partial V_n} \right)^{(p)} \\ \left( \frac{\partial P_3}{\partial \delta_2} \right)^{(p)} & \left( \frac{\partial P_3}{\partial \delta_3} \right)^{(p)} & \dots & \left( \frac{\partial P_3}{\partial \delta_n} \right)^{(p)} & \left( \frac{\partial P_3}{\partial V_2} \right)^{(p)} & \left( \frac{\partial P_3}{\partial V_3} \right)^{(p)} & \dots & \left( \frac{\partial P_3}{\partial V_n} \right)^{(p)} \\ \vdots & \vdots & \dots & \vdots & \vdots & \vdots & \dots & \vdots \\ \left( \frac{\partial P_n}{\partial \delta_2} \right)^{(p)} & \left( \frac{\partial P_n}{\partial \delta_3} \right)^{(p)} & \dots & \left( \frac{\partial P_n}{\partial \delta_n} \right)^{(p)} & \left( \frac{\partial P_n}{\partial V_2} \right)^{(p)} & \left( \frac{\partial P_n}{\partial V_3} \right)^{(p)} & \dots & \left( \frac{\partial P_n}{\partial V_n} \right)^{(p)} \end{matrix} \begin{matrix} \Delta \delta_2^{(p)} \\ \Delta \delta_3^{(p)} \\ \vdots \\ \Delta \delta_n^{(p)} \end{matrix} \\
 &+ \begin{matrix} \left( \frac{\partial Q_2}{\partial \delta_2} \right)^{(p)} & \left( \frac{\partial Q_2}{\partial \delta_3} \right)^{(p)} & \dots & \left( \frac{\partial Q_2}{\partial \delta_n} \right)^{(p)} & \left( \frac{\partial Q_2}{\partial V_2} \right)^{(p)} & \left( \frac{\partial Q_2}{\partial V_3} \right)^{(p)} & \dots & \left( \frac{\partial Q_2}{\partial V_n} \right)^{(p)} \\ \left( \frac{\partial Q_3}{\partial \delta_2} \right)^{(p)} & \left( \frac{\partial Q_3}{\partial \delta_3} \right)^{(p)} & \dots & \left( \frac{\partial Q_3}{\partial \delta_n} \right)^{(p)} & \left( \frac{\partial Q_3}{\partial V_2} \right)^{(p)} & \left( \frac{\partial Q_3}{\partial V_3} \right)^{(p)} & \dots & \left( \frac{\partial Q_3}{\partial V_n} \right)^{(p)} \\ \vdots & \vdots & \dots & \vdots & \vdots & \vdots & \dots & \vdots \\ \left( \frac{\partial Q_n}{\partial \delta_2} \right)^{(p)} & \left( \frac{\partial Q_n}{\partial \delta_3} \right)^{(p)} & \dots & \left( \frac{\partial Q_n}{\partial \delta_n} \right)^{(p)} & \left( \frac{\partial Q_n}{\partial V_2} \right)^{(p)} & \left( \frac{\partial Q_n}{\partial V_3} \right)^{(p)} & \dots & \left( \frac{\partial Q_n}{\partial V_n} \right)^{(p)} \end{matrix} \begin{matrix} \Delta V_2^{(p)} \\ \Delta V_3^{(p)} \\ \vdots \\ \Delta V_n^{(p)} \end{matrix}
 \end{aligned}$$

So, in this case that bus one is a slack bus and  $p$  is the iteration count. So, it will be  $\Delta P_2^{(p)} \Delta P_3^{(p)} \dots \Delta P_n^{(p)}$  this is  $p$  part then there is a mismatch and  $\Delta Q_2^{(p)} \Delta Q_3^{(p)} \dots \Delta Q_n^{(p)}$  is equal to is equal to right look at this matrix right.

(Refer Slide Time: 14:01)

The image shows a handwritten mathematical derivation on a blue background. It consists of two main parts, one above an equals sign and one below. Both parts are structured as a chain rule expansion for partial derivatives.

**Top part (p derivatives):** The left side shows a column of partial derivatives of  $p$  with respect to  $\delta_2, \delta_3, \dots, \delta_n$ . The right side shows a row of partial derivatives of  $p$  with respect to  $V_2, V_3, \dots, V_n$ . The middle part shows the chain rule expansion with partial derivatives of  $p$  with respect to  $\delta_i$  and  $V_i$ . A red 'J1' is written in the middle.

**Bottom part (q derivatives):** The left side shows a column of partial derivatives of  $q$  with respect to  $\delta_2, \delta_3, \dots, \delta_n$ . The right side shows a row of partial derivatives of  $q$  with respect to  $V_2, V_3, \dots, V_n$ . The middle part shows the chain rule expansion with partial derivatives of  $q$  with respect to  $\delta_i$  and  $V_i$ . A red 'J2' is written in the middle.

The two parts are equated, and the Jacobian matrices are identified as  $J_1$  and  $J_2$ .

So, this is  $\Delta p_2$  up to  $p$  every look everywhere  $p$  means iteration count. So, I am not telling again and again  $p$ , but you can see it here everywhere  $p$  means iteration count I will just tell this partial derivatives.

$\Delta p_2$  upon  $\Delta \delta_2$   $\Delta p_2$  upon  $\Delta \delta_3$   $\Delta p_2$  upon  $\Delta \delta_n$  right this is with respect to  $\Delta$  and this side is  $\Delta \delta_2$   $\Delta \delta_3$   $\Delta \delta_n$  the next one is  $\Delta V_2$   $\Delta V_3$   $\Delta V_n$  these are all changes in magnitude right and then  $\Delta p_2$  upon  $\Delta V_2$   $\Delta p_2$  upon  $\Delta V_3$   $\Delta p_2$  upon  $\Delta V_n$  these all are magnitude, but not telling again and again under stable right.

Similarly,  $\Delta p_3$   $\Delta \delta_2$   $\Delta p_3$   $\Delta \delta_3$   $\Delta p_3$   $\Delta \delta_n$ ; that means, when you take for  $\Delta p_2$   $\Delta p_2$  all the derivative are taking with respect to  $\Delta \delta_2$   $\Delta \delta_3$   $\Delta \delta_n$  with these right and when you and so it is  $\Delta p_2$  upon  $\Delta \delta_2$   $\Delta p_2$  upon  $\Delta \delta_3$  and so on and this part will be  $\Delta p_2$  upon  $\Delta V_2$   $\Delta p_2$  upon  $\Delta V_3$  and so on.

Similarly, here  $\Delta p_3$   $\Delta \delta_2$   $\Delta p_3$  upon  $\Delta \delta_3$  and  $\Delta p_3$  upon  $\Delta \delta_n$  similarly here  $\Delta p_3$  upon  $\Delta V_2$   $\Delta p_3$  upon  $\Delta V_3$   $\Delta p_3$  upon  $\Delta V_n$  right this way you come up to  $n$ th term similarly for  $q$  also  $\Delta q_2$  upon  $\Delta \delta_2$   $\Delta q_2$  upon  $\Delta \delta_3$   $\Delta q_2$  upon  $\Delta \delta_n$  and here  $\Delta q_2$  upon  $\Delta V_2$  voltage magnitude off course  $\Delta q_2$  upon  $\Delta V_3$   $\Delta q_2$  upon  $\Delta V_n$  right this way you can construct.

So, this is actually this is actually partition here it is one here assuming that all the buses are  $p$   $q$  buses for this one right later will see  $P$   $V$  bus. So, and this is  $\Delta P$   $\Delta Q$   $\Delta V_2$   $\Delta V_3$   $\Delta V_n$  and this is  $\Delta V_2$   $\Delta V_3$   $\Delta V_n$  these are all magnitude. So, this is equation actually 52 right.

So, this equation this part this one actually this equation is  $n-1$  into  $n-1$  because bus one is just slack bus this partition this matrix is  $n-1$  into  $n-1$  this is also  $n-1$  into  $n-1$  this is also  $n-1$  into  $n-1$ ; that means, as a whole dimension of a matrix is  $2$  into  $n-1$  into  $2$  into  $n-1$  right.

(Refer Slide Time: 16:35)

In Eqn.(52), bus-1 is assumed to be the slack bus. (74)

Eqn.(52) can be written in short form, i.e.,

$$\Rightarrow \begin{bmatrix} \Delta P \\ \Delta Q \end{bmatrix} = \begin{bmatrix} J_2 & J_3 \\ J_4 & J_1 \end{bmatrix} \begin{bmatrix} \Delta \delta \\ \Delta V \end{bmatrix} \dots (53)$$

**DECOUPLED LOAD FLOW SOLUTION**

Transmission lines of power systems have a very low  $R/X$  ratio. For such system, real power mismatch  $\Delta P$  are less sensitive to changes in the voltage magnitude and are very sensitive to changes in phase angle  $\Delta \delta$ .

So; that means, this equation; equation 52 bus 1 is assumed to be the slack bus. So, this equation can be written in general that  $\Delta P$   $\Delta Q$  is equal to  $J_1$   $J_2$   $J_3$   $J_4$   $\Delta \delta$   $\Delta V$  right. So,  $\Delta P$  is equal to not writing here and  $\Delta P$  is equal to  $\Delta P_2$   $\Delta P_3$   $\Delta P_n$  this vector and  $\Delta Q$  is equal to  $\Delta Q_2$   $\Delta Q_3$   $\Delta Q_n$  right and  $J_1$  is equal to this matrix right that and  $\Delta J_2$  is equal to this matrix  $J_3$  is equal to this one and  $J_4$  is equal to 1 right.

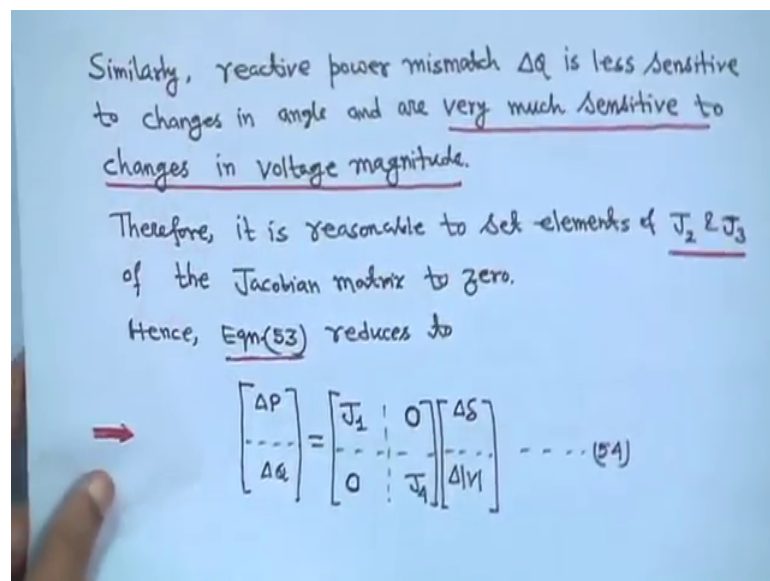

Now, generally what happened in transmission line power system right they have a very low  $R$  by  $x$  ratio right where  $R$  is less and reactance is high right. So, process system real power mismatch  $\Delta P$  are less sensitive to changes in the voltage magnitude; that means, if you take the derivative  $\Delta P_2$   $\Delta V_2$  this changes  $R$  your real power changes this is your not very voltage sensitive right.

There for real power mismatch  $\Delta p$  are less sensitive to changes in the voltage magnitude and very sensitive to changes in the phase angle I mean there are these are these are significant right very sensitive in changes in phase angle, but not very sensitive with that this thing changes in this one voltage magnitude right with respect to that right. So, in that case what will do this; this term this term will neglect this matrix will neglect right only this one will consider.

Similarly, just a similarly the reactive power mismatch  $\Delta q$  the reactive power mismatch  $\Delta q$  is less sensitive changes in angles. So, this part that reactive power changes is quite less sensitive. So, the changes in angle, but very sensitive to the changes in voltage magnitude; that means, this part and this part will drop right this matrix will not consider, but will consider this 1 and this 1 right.

(Refer Slide Time: 18:39)

So; that means, that this is my J 1 this is J 2 this is J 3 this is J four; that means, that J 2 and J 3 the sub set to 0. So, these 2 things will not considered, but J 1 and J 4 will be considered the delta delta delta V right because this is your V 1 decoupled right and that one and if you consider this one if you consider this one this is coupled this is coupled right.

So; that means, you can write  $\Delta p$  is equal to J 1  $\Delta \delta$  and  $\Delta q$  is equal to J 4  $\Delta |V|$  magnitude  $\Delta V$  understandable right. So, this is equation 54 so; that means,  $\Delta p$  is equal to J 1  $\Delta \delta$  this is equation 55 and  $\Delta q$  is equal to J 4  $\Delta V$  this

is equation 56 right therefore, for voltage control buses the voltage magnitude are known right.

(Refer Slide Time: 19:27)

OR,

$$\rightarrow \Delta P = J_1 \cdot \Delta \delta \quad \dots (55)$$

$$\rightarrow \Delta Q = J_4 \cdot \Delta |V| \quad \dots (56)$$

For voltage controlled buses, the voltage magnitudes are known. Therefore, if "m" buses of the system are voltage controlled,  $J_1$  is of the order  $(n-1) \times (n-1)$  and  $J_4$  is of the order  $(n-1-m) \times (n-1-m)$ .

That means if an voltage control bus voltage magnitudes are known therefore, m buses of the system are voltage control bus  $J_1$  will be always if the order of a n minus 1 into n minus 1 because this  $J_1$  matrix this is your; this is your  $J_1$  matrix this is this matrix actually this matrix your  $J_1$  this is your  $J_1$  matrix and this matrix actually your  $J_4$  right.

So, if it is P V bus if you will be consider that in P V bus q and delta this is p and voltage magnitude known q and delta unknown right. So, this will remain as a n minus 1 into n minus 1 matrix this one right, but when you have a P V bus this thing. So, in this case what will happens suppose in general you have a n bus system and you have n m number of P V buses right then this  $J_4$  order of the  $J_4$  will become n minus 1 minus m into n minus 1 minus m because voltage magnitude is known right.

So, in that here those wherever voltage wherever the buses where voltage magnitudes are known for P V bus those delta V changes will not appear here right similarly here in this. That means, that  $J_4$  that  $J_4$  is the order of n minus 1 minus m into n minus 1 minus m right suppose you have a 10 bus problem then  $J_1$  will be 9 into 9 matrix and suppose in 10 bus problem you have 3 your what you call 3 P V buses then it will be 10 minus 1 minus 3. That means, it will be 6 into 6  $J_4$  will be 6 into 6, but this one will be 9 into 9.

So, later will see when we consider P V bus will take one example right. Now, what you call that the diagonal elements of J 1. So, this is the J 1 matrix. So, diagonal elements is  $\frac{\partial P_i}{\partial \delta_i}$  upon  $\delta_i$  right. So, this way we have to first diagonal then off diagonal elements right first diagonal then off diagonal elements we have to obtain right.

Therefore, this is your just hold on this is your; this is your expression of  $\frac{\partial P_i}{\partial \delta_i}$  right. So, this is your expression of  $\frac{\partial P_i}{\partial \delta_i}$  right this is expression of  $\frac{\partial P_i}{\partial \delta_i}$ .

(Refer Slide Time: 22:13)

Now the diagonal elements of  $J_1$  are

$$\frac{\partial P_i}{\partial \delta_i} = \sum_{\substack{k=1 \\ k \neq i}}^n |V_i||V_k||Y_{ik}| \sin(\theta_{ik} - \delta_i + \delta_k) \dots (57)$$

Off-diagonal elements of  $J_1$  are

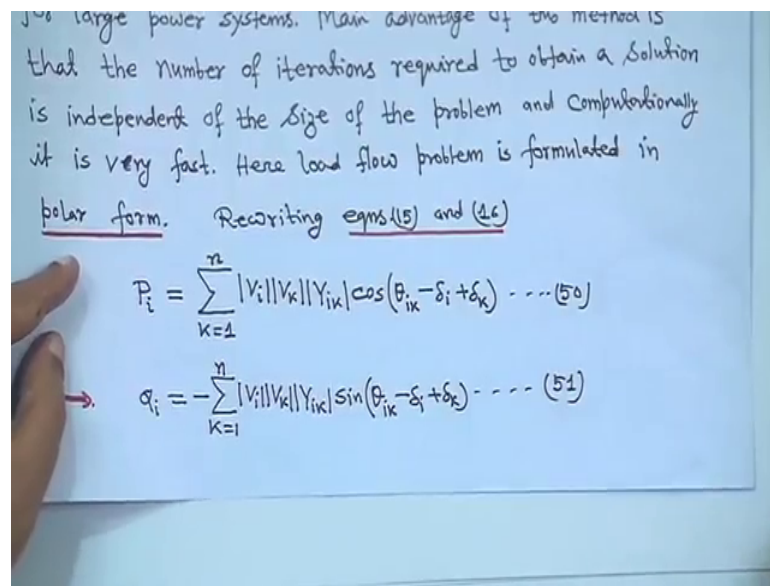

$$\frac{\partial P_i}{\partial \delta_k} = -|V_i||V_k||Y_{ik}| \sin(\theta_{ik} - \delta_i + \delta_k), \dots (58)$$

So, in this here you have to take the derivative now right. So, what you will do that your first is you take  $\frac{\partial P_i}{\partial \delta_i}$  if you take  $\frac{\partial P_i}{\partial \delta_i}$  diagonal element is  $k$  is equal to  $i$  and  $k$  not is equal to  $i$ .

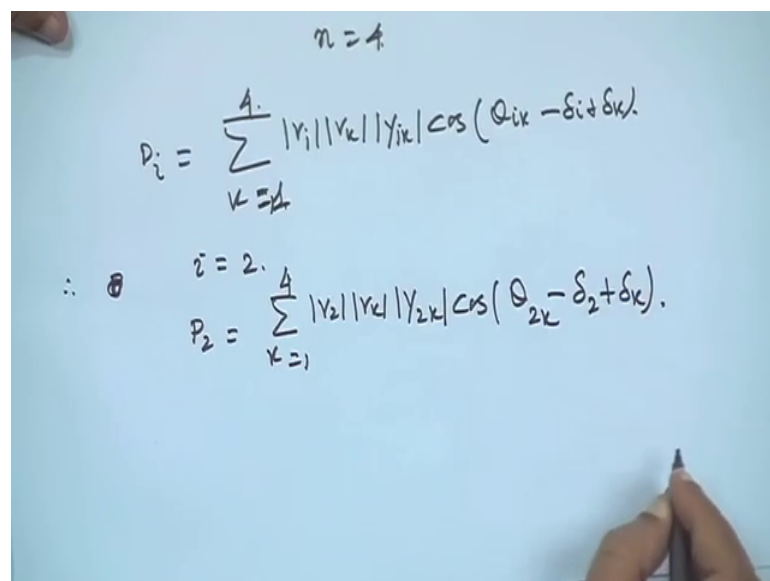

If take the derivative one it will be  $V_i V_k Y_{ik}$  right cosine if you take derivative minus and with respect to minus  $\delta_i$  is another minus will come out. So, ultimately it will be your plus. So, it will be  $V_i V_k Y_{ik} \sin(\theta_{ik} - \delta_i + \delta_k)$ , but this summation symbol will be there now question is that for your clarification what we will do that why this summation thing comes right.

So, what you can do is just for your just for your this thing just hold on just for your understanding right for example, you take you just hold on you take this one right.

(Refer Slide Time: 23:20)

(Refer Slide Time: 23:27)

You take this equation this equation right let us let us for just for the purpose of understanding suppose n is equal to suppose n is equal to say 4 right and this equation this pi equation we can write like this that p i; p i is equal to say k is equal to 1 to 4 right.

Then V i then V k then y i k then cosine theta ik minus delta I plus delta k and your what to call this is the thing right. So, k is equal to 1 top on now you expand right if you expand then your say this is your pi now you have to expand your something say I is equal to say I is equal to 2 because bus one is a slack bus say I is equal to 2.

That means my  $p_2$  will be equal to  $k$  is equal to 1 to 4 right then  $V_2$  then  $V_k$  then  $y_2$   $k$  then cosine then theta I is equal to  $2k$  minus delta  $2$  plus delta  $k$  right now you know what you do you expand you just I will show 1 then you will know. So, now, you expand this right if you expand this then your  $p_2$  will become right.

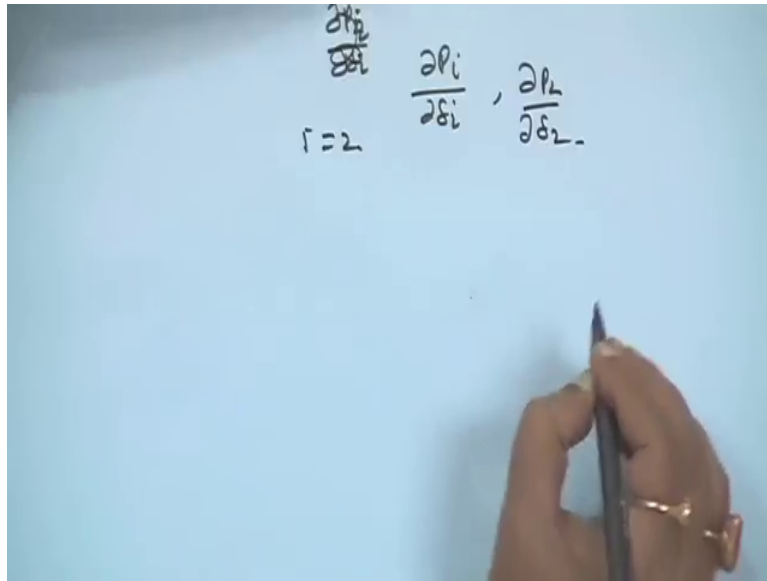

(Refer Slide Time: 24:50)

The image shows a whiteboard with handwritten mathematical equations. At the top, a summation formula is written: 
$$P_2 = \sum_{k=1} |V_2| |V_k| |Y_{2k}| \cos(\theta_{2k} - \delta_2 + \delta_k).$$
 Below this, the first four terms of the summation are expanded: 
$$P_2 = |V_2| |V_1| |Y_{21}| \cos(\theta_{21} - \delta_2 + \delta_1) + |V_2| |V_2| |Y_{22}| \cos(\theta_{22} - \delta_2 + \delta_2) + |V_2| |V_3| |Y_{23}| \cos(\theta_{23} - \delta_2 + \delta_3) + |V_2| |V_4| |Y_{24}| \cos(\theta_{24} - \delta_2 + \delta_4)$$

So, it will become  $V_2$  and then  $V_1$  then  $y_{21}$  right then cosine theta  $21$  minus delta  $2$  plus delta one right then plus your  $V_2$  then  $k$  is equal to 2. So,  $V_2$  it will be  $V_2$  square actually right  $V_2$  into  $V_2$   $V_2$  square anyway then  $y_{22}$  cosine theta  $22$  minus delta  $2$  plus delta 2. So, this delta  $2$  delta  $2$  will be cancelled right.

Then plus your  $V_2$  then your  $V_3$  then  $Y_{23}$  then cosine theta  $23$  minus delta  $2$  plus delta 3 this is the third when we have taken one more four. So, plus in  $k$  is equal to 4  $V_2$  then your  $V_4$  then  $y_{24}$  right then cosine theta  $24$  minus delta  $2$  plus delta 4 right this is the this is the fourth term we have taken, but this is actually  $V_2$  square right.

(Refer Slide Time: 26:20)

So, this  $\delta_2 \delta_2$  will be cancelled now if you take derivative say we have taking the derivative in general  $\delta_2$  upon  $\delta_1$  upon  $\delta_1$  upon  $\delta_1$  upon  $\delta_1$  we are taking the derivative right say it is diagonal. So,  $r$  is equal to 2; that means,  $\delta_2$  upon  $\delta_2$  to take the derivative of this equation with respect to your  $\delta_2$  right.

If you take the derivative with respect to  $\delta_2$  you will find  $\delta_2$  is here. So, if you take if you take this term with derivative exist similarly here it is independent of your this thing second term that  $V^2 \cos^2 \theta_2$  right.

(Refer Slide Time: 27:06)

$$P_2 = |V_2| |V_1| |V_2| \cos(\theta_{21} - \delta_2 + \delta_1) + |V_2|^2 |V_2| \cos(\theta_{22}) + |V_2| |V_3| |V_2| \cos(\theta_{23} - \delta_2 + \delta_3) + |V_2| |V_4| |V_2| \cos(\theta_{24} - \delta_2 + \delta_4)$$

$$\frac{\partial P_2}{\partial \delta_2} = |V_2| |V_1| |V_2| \sin(\theta_{21} - \delta_2 + \delta_1) + |V_2| |V_3| |V_2| \sin(\theta_{23} - \delta_2 + \delta_3) + |V_2| |V_4| |V_2| \sin(\theta_{24} - \delta_2 + \delta_4)$$

So, if I rewrite once again if I rewrite once again right it will be  $P_2$  will be is equal to  $V_2 V_1 y_{21} \cos \theta_{21} - \delta_2 + \delta_1$  then plus this is this is  $V_2$  into  $V_2$ . So, it is  $V_2$  square then  $y_{22}$  then  $\cos \theta_{22}$  because  $\delta_2 - \delta_2$  will be cancel next term is  $V_2$  then  $V_3$  then  $y_{23}$  then  $\cos \theta_{23} - \delta_2 + \delta_3$  right.

Then last term is  $V_2$  then  $V_4$  then  $y_{24}$  then  $\cos \theta_{24} - \delta_2 + \delta_4$  right with these term when you take the derivative  $\frac{\partial P_2}{\partial \delta_2}$  upon when you take  $\frac{\partial P_2}{\partial \delta_2}$  upon  $\delta_2$  this one will be there and the derivative exist  $\delta_2$  here this term no  $\delta_2$  it will be 0, but here also  $\delta_2$  is there here also  $\delta_2$  is there here also  $\delta_2$  is there; that means, if you take it is  $V_2 V_1 y_{21}$  right.

If you take minus because of cosine minus and because of minus  $\delta_2$  another minus will come out; so, it will be plus. So,  $\sin \theta_{21} - \delta_2 + \delta_1$  right this is the first term second term is 0 it is not there loop with respect to 2, but this  $\theta_{22}$  terms not there right plus  $V_2 V_3$  then  $y_{23}$  then here also  $\sin \theta_{23} - \delta_2 + \delta_3$  right.

And last term  $V_2$  then your  $V_4$  then your  $y_{24}$  right then  $\sin \theta_{24} - \delta_2 + \delta_4$  right. So, all the 3 terms are there only second term is not there right because this is that  $i$  th term  $i$  is equal to 2. So, it is independent of  $\delta_2$ . So, this will vanish. So, this is 0 right; that means, 3 terms are there that is why when you take the derivative

of this one derivative of this one that diagonal one right diagonal one it is  $V_i V_k y_i k$  sin because everywhere sin is there everywhere sin is there right.

So, magnitude  $V_i V_k y_i k \sin \theta_i k$  minus  $\Delta I$  plus  $\Delta k$  is equal to 1 to and  $k$  not is equal to  $I$  because when  $I$  is equal to 2 this term is independent of  $\Delta i$ . So, it will become 0. So, that is why that  $k$  not is equal to  $I$ . Although in the equation everything  $k$  is equal to 1 to  $n$  only right, but this  $\Delta \pi$  that diagonal element is sum of all this things, but  $k$  not is equal to  $i$ , but with a sin multiplication this is equation 57.

Thank you, again we are coming.
