**Application on Navier Stoke's Equation for finding out viscosity (Part 2)**

So in the previous problem we have seen that this is nothing but a jugglery of the boundary conditions, the original equation remaining similar. Now in the 2 cases we have seen that outer cylinder was rotating and inner cylinder was fixed, right? And that can give you way of finding out the velocity profile also the way of finding out the viscosity in many instruments they had we had earlier said that Brookfield viscometer uses the similar situation. Now if the condition is little different that if instead of outer cylinder rotating and inner one fixed and we played with the radii, right?

We made the outer cylinder 1 radii, inner cylinder another radii, of course the velocity expression that becomes different right, so if we do the other one then the outer one is fixed and the inner one is rotating, right. In that case you take the former equation that is the first one like that and then let us see how it happens? Okay.

(Refer Slide Time: 1:56)

**Problem 1:-** If an incompressible fluid is flowing between two vertical coaxial cylinders, and the inner one is rotating with an angular velocity  $\omega$ , determine the velocity for the tangential laminar flow.

**Solution:** The flow is laminar and the fluid moves in a circular pattern.

Hence, from the physical understanding of the problem, the velocity components,  $v_r = v_z = 0$ , and  $\partial v_\theta / \partial \theta = 0$

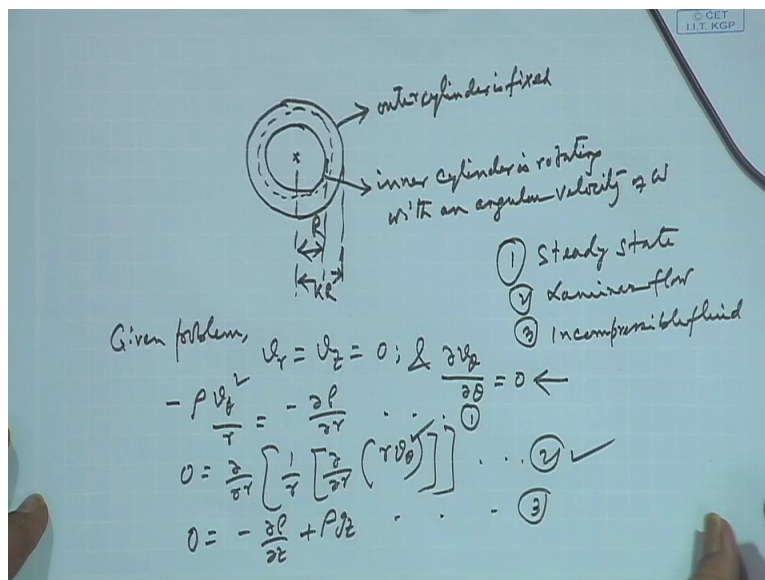

From Navier Stokes equation -  $\rho v_\theta^2 / r = - \partial p / \partial r$

  NPTEL ONLINE CERTIFICATION COURSES 

So here the same problem if an incompressible fluid is flowing between 2 vertical coaxial cylinders, and the inner one is rotating with than angular velocity  $\omega$ , determine the velocity for the tangential laminar flow, right? Now the inner one is rotating and the outer one is fixed, so this outer cylinder is stationary and inner one is fixed rotating rather with an angular velocity of  $\omega$ , right?

(Refer Slide Time: 2:59)

And kept that  $R$  and  $kR$  as the 1<sup>st</sup> case that this is  $R$  and this is  $kR$ , right. If you keep them like that then we can say that the problem can be defined like this, we have one inner cylinder, we have one outer cylinder this is the center, right. This outer cylinder is fixed and the inner cylinder is rotating with an angular velocity of  $\omega$ , right. And we get as earlier the same, this is  $R$  and this is  $kR$  that is  $k$  is multiple more than one, right. So that  $kR$  is

greater than R right? So if we take this problem and solve so like the previous one on earlier cases if we use the Navier Stokes Equation, right.

So we can write and here also we have the number 1 steady state number 2 number 2 your laminar flow, number 3 is incompressible fluid and of course others like flow is fully developed there is no in defect all these are also there, right. So we can write from the Navier Stokes Equation right the same as earlier right from the given problem by physical understanding of the problem we can write  $V_r$  is equal to  $V_z$  is equal to 0 and  $\frac{\partial V_\theta}{\partial \theta}$  is also 0 that means this is not changing with the theta, right.

So if that be true then this is the understanding of the problem we can write and from the Navier Stokes Equation we can write  $\rho V_\theta^2$  by  $r$  this equals to minus  $\frac{\partial p}{\partial r}$ , right? This was our 1<sup>st</sup> equation, 2<sup>nd</sup> equation we can write that 0 is equal to  $\frac{\partial}{\partial r} \left( \frac{1}{r} \frac{\partial}{\partial r} (r V_\theta) \right)$  by  $r$   $\frac{\partial}{\partial r} (r V_\theta)$  right, so this was our 2<sup>nd</sup> equation and the 3<sup>rd</sup> equation we can write 0 is equal to minus  $\frac{\partial p}{\partial z}$  plus  $\rho g_z$ , right. Now from these 3 questions since we need the solution of  $V_\theta$ .

(Refer Slide Time: 7:17)

$$0 = \frac{\partial}{\partial r} \left[ \frac{1}{r} \left( \frac{\partial}{\partial r} (r V_\theta) \right) \right]$$
 Integrating w.r.t  $r$ ,  $\frac{1}{r} \left( \frac{\partial}{\partial r} (r V_\theta) \right) = A$   
 Integrating w.r.t  $r$ ,  $\frac{\partial}{\partial r} (r V_\theta) = A r$   
 $r V_\theta = \frac{A r^2}{2} + B$   
 $w. V_\theta = \frac{A r}{2} + \frac{B}{r}$  → (A)

B.C. ①  $r = KR; V_\theta = 0$   
 ②  $r = 0; V_\theta = KR$  at  $r = R$   
 In eqn (A)  $V_\theta = 0$

Integrating  $\frac{1}{r} \left[ \frac{\partial}{\partial r} (r v_\theta) \right] = A$   
 Integrating  $\frac{\partial}{\partial r} (r v_\theta) = A r$   
 $r v_\theta = \frac{A r^2}{2} + B$   
 $v_\theta = \frac{A r}{2} + \frac{B}{r}$  → A  
 B.C. ①  $v_\theta = 0$  at  $r = KR$   
 ②  $v_\theta = \Omega R$  at  $r = R$   
 In eq ①  $v_\theta = 0$  at  $r = KR$   
 $0 = \frac{A(KR)}{2} + \frac{B}{KR}$  ... ②  
 In eq ②  $v_\theta = \Omega R$  at  $r = R$   
 $\Omega R = \frac{A R}{2} + \frac{B}{R}$  ... ③ ✓  
 Sol. ②;  $\frac{B}{KR} = -\frac{A(KR)}{2}$  ∴  $\left(\frac{B}{R}\right) = -\frac{AKR}{2}$  ... ④  
 In eq ③;  $\Omega R = \frac{AR}{2} + \left(-\frac{AKR}{2}\right)$   
 $\Omega R = \frac{AR}{2} - \frac{AKR}{2} = AR \left[ \frac{1}{2} - \frac{K}{2} \right] = A$

So this equation we take then we can lead to the solution and that equation if we rewrite we can write  $\frac{1}{r} \frac{\partial}{\partial r} (r v_\theta) = A$ , this is equals to 0, right and we also wrote that on first integration we write that on first integration we write  $\frac{\partial}{\partial r} (r v_\theta) = A r$ , right this equals to A. On simplification we write  $\frac{\partial}{\partial r} (r v_\theta) = A r$ , right. On 2<sup>nd</sup> integration we will write, integrating again integrating. On 2<sup>nd</sup> integration we can write that  $r v_\theta = \frac{A r^2}{2} + B$  or  $v_\theta = \frac{A r}{2} + \frac{B}{r}$ .

So again up to this that is the equation A the solution remains identical. Where we are seeing the change? The changes are in the boundary conditions because our boundaries are changing, right? Either with the diameter or radii or with the condition of physical condition of the problem, they are changing so boundary conditions are changing. So this is again nothing but a change of the boundary conditions, right.

So we write the boundary condition 1 what is given we have been given said that the inner cylinder is rotating and the outer cylinder is fixed right. So we have that  $R$  is equal to  $R$  and that  $R$  is equal to  $KR$ , two different conditions, so what are those 2 different conditions? (9:50) one if we write that  $r$  is equal to  $KR$   $v_\theta = 0$  because this outer cylinder is fixed, right outer cylinder is fixed, so  $v_\theta = 0$  and  $r$  is equal to  $KR$ , right. So  $r$  is equal to  $KR$   $v_\theta = 0$  this is boundary one and boundary 2 is  $r$  is equal to  $R$   $v_\theta = \Omega R$ , right so these are the 2 boundaries we have to substitute, right?

These other 2 boundaries we have to substitute and when we are substituting them then we see that the first one at  $r$  is equal to  $KR$   $V$  theta is equal to 0, we put this in equation 1 or A, if we put  $V$  theta is equal to 0 at  $r$  is equal to  $kr$  we get what so  $V$  theta is 0,  $r$  is  $KR$  so it is  $AKR$  by 2 plus  $B$  by  $KR$  right, so this is say equation B and second equation is  $V$  theta is  $\omega R$  at  $r$  is equal to  $KR$  so we right here again from equation A we get that  $V$  theta is equal to  $\omega R$  right at  $r$  is equal to capital  $R$  so it is  $AR$  divided by 2 plus  $B$  by  $R$ , right. So again by substituting one this is C, so by substituting one that is that is B is from B we can write we can write  $B$  by  $KR$  is equal to minus  $AKR$  by 2 or we can write  $B$  by  $R$  is equal to minus  $A K$  square  $R$  by 2.

So if we substitute this  $B$  by  $R$  right if we substitute this  $B$  by  $R$  into C we can write from equation C we can write that  $\omega R$  is equal to  $AR$  by 2 plus  $B$  by  $R$  has become minus plus minus  $A K$  square  $R$  by 2, right or we can write  $\omega R$  is equal to  $AR$  by 2 minus  $AK$  square  $R$  by 2, right so this on simplification we can write A if we take out or  $AR$  also if we take out then we can write this is 1 by 2 minus this is  $K$  square by 2 is equal to  $AR$  into 1 minus  $K$  square by 2, right.

(Refer Slide Time: 15:05)

Handwritten mathematical derivation on a whiteboard:

$$WR = AR \left[ \frac{1 - K^2}{2} \right]$$

$$\omega, A = \frac{2W}{1 - K^2} \dots \textcircled{E} \checkmark$$

from Eq (D):

$$\frac{A}{R} = - \frac{AK^2 R}{2} = - \left[ \left( \frac{2W}{1 - K^2} \right) \frac{KR^2}{2} \right]$$

$$A = - \frac{2WK^2 R^2}{2(1 - K^2)} = - \left( \frac{WK^2 R^2}{1 - K^2} \right)$$

from Eq (B):

$$0 = \frac{AKR}{2} + \frac{B}{KR} = \frac{2W}{1 - K^2} \frac{KR}{2} + \left[ \frac{-WK^2 R^2}{1 - K^2} \right]$$

$$= \frac{WK^2 R}{1 - K^2} - \frac{WK^2 R^2}{1 - K^2}$$

from Eq (A):

$$Q_0 = \frac{AR}{2} + \frac{B}{r} = \frac{2W}{1 - K^2} +$$

$$\begin{aligned}
 \text{from (A): } & A = \frac{2W}{1-K^2} \quad \text{--- (E) ✓} \\
 \text{from (D): } & \frac{B}{R} = -\frac{AK^2R}{2} = -\left(\frac{2W}{1-K^2}\right) \frac{K^2R}{2} \\
 & B = -\frac{2WK^2R^2}{2(1-K^2)} = -\left(\frac{WK^2R^2}{1-K^2}\right) \\
 \text{from (15): } & 0 = \frac{AKR}{2} + \frac{B}{KR} = \frac{2W}{(1-K^2)} \frac{KR}{2} + \left[-\frac{WK^2R^2}{(1-K^2)}\right] \\
 & = \frac{WK^2R}{1-K^2} - \frac{WK^2R^2}{1-K^2} \\
 \text{from (A): } & \theta = \frac{AY}{2} + \frac{B}{r} = \frac{2WY}{2(1-K^2)} + \frac{1}{r} \left[-\frac{2WK^2R^2}{(1-K^2)}\right] \\
 & = \frac{WY}{(1-K^2)} - \frac{1}{r} \frac{WK^2R^2}{(1-K^2)} = W \left[ \frac{Y}{(1-K^2)} - \frac{K^2R^2}{r(1-K^2)} \right]
 \end{aligned}$$

So we can write from there that we can write from there that omega R is equal to AR into 1 minus K square by 2 or A is equal to omega or 2 omega by 1 minus K square. So if A is equal 2 omega 1 minus K square so this is relation E we can write from the other one relation B from equation D we can write B by R is equal to minus A K square R by 2, right is equal to if we write K value so it is B by R is equal to A is minus then 2 omega by 1 minus K square, this is one into K square R by 2, right. So V (( ))(16:23) equals to minus 2 omega K square this R into R goes R square by 2 into 1 minus K square right, so if you substitute A and B in the original equation that is that is either B or C right.

So if we substitute them in B we have 0 is equal to AKR by 2 plus B by KR right, so this is equal to value of A we know, this is 2 omega by 1 minus K square right and KR by 2 plus right this is minus we are substituting B by KR right so this is 1 by KR we will write afterwards so B is equal to minus 2 omega K square R square divided by 2 into 1 minus K square so this of course 2 2 goes out so we could write it minus omega K square R square by 1 minus K square, this is for B so we substitute this 2 and we can re-write this is equal to 2 omega KR omega KR so this 2 and this 2 goes out so this 2 also was not there so 1 minus K square right, omega KR by 1 minus K square this is minus so this is omega K square R square by 1 minus K square right.

So if that is true we can write this substitution we should have done not here at we should have done at this equation A from equation A sorry this should not have been otherwise V theta is not coming. V theta is Ar by 2 plus B by r, right. So here we are substituting A as 2 omega by 1 minus K square into 2 so this 2 this 2 goes out this is the Ar by 2 plus plus b or 1

by  $r$  into  $\frac{-2\omega k^2 R^2}{2}$  this  $2$  of course goes out so one minus  $k^2 R^2$  right.

So we can write now that  $\frac{\omega}{1 - k^2} - \frac{1}{r}$  right. Ar by  $2$  so it was  $2\omega$  into  $r$  right, so  $\frac{2\omega r}{1 - k^2} - \frac{1}{r}$  and this is  $\frac{2\omega k^2 R^2}{1 - k^2}$  right. So this is the  $v_\theta$  which of course we can further simplify as  $\omega$  if we take common then  $\frac{1}{r} - \frac{1}{r}$  minus  $\frac{2\omega k^2 R^2}{1 - k^2}$  minus  $\frac{2\omega k^2 R^2}{1 - k^2}$  out so  $\frac{2\omega k^2 R^2}{1 - k^2}$  right. So this is the solution right, so if we look at then this should be the solution.

(Refer Slide Time: 21:40)

BC  $v_\theta = 0$  at  $r = kR$  and  
 $v_\theta = \omega R$  at  $r = R$   
 $A = \frac{2\omega}{1 - k^2}$ , and  $B = -\frac{\omega(kR)^2}{1 - k^2}$   
 And,  $v_\theta = \frac{\omega}{k^2 - 1} \left[ \frac{(kR)^2}{r} - r \right]$

NPTEL ONLINE CERTIFICATION COURSES

$\omega, A = \frac{2\omega}{1 - k^2} \checkmark \text{ (E) } \checkmark$   
 from eq (D):  
 $\frac{A}{R} = -\frac{Ak^2 R}{1 - k^2} = -\left[ \frac{2\omega}{1 - k^2} \right] \frac{k^2 R}{2}$   
 $B = -\frac{2\omega k^2 R^2}{2(1 - k^2)} = -\frac{\omega k^2 R^2}{1 - k^2}$   
 $0 = \frac{AkR}{2} + \frac{B}{kR} = \frac{2\omega}{(1 - k^2)} \frac{kR}{2} + \left[ -\frac{\omega k^2 R^2}{1 - k^2} \right] \frac{1}{kR}$   
 $= \frac{\omega kR}{1 - k^2} - \frac{\omega k^2 R}{1 - k^2}$   
 from eq (A)  
 $v_\theta = \frac{A}{2} + \frac{B}{r} = \frac{2\omega}{2(1 - k^2)} + \left[ -\frac{\omega k^2 R^2}{1 - k^2} \right] \frac{1}{r}$   
 $= \frac{\omega}{1 - k^2} - \frac{1}{r} \frac{\omega k^2 R^2}{1 - k^2} = \omega \left[ \frac{1}{1 - k^2} - \frac{k^2 R^2}{r(1 - k^2)} \right]$

$$\begin{aligned}
 \omega, A &= \frac{2W}{1-k^2} \quad \checkmark \quad \textcircled{E} \quad \checkmark \\
 \text{from eq (D):} \quad \frac{A}{R} &= -\frac{Ak^2R}{2} = -\left[\frac{2W}{1-k^2}\right] \frac{k^2R}{2} \\
 B &= -\frac{2Wk^2R^2}{2(1-k^2)} = -\left[\frac{Wk^2R^2}{1-k^2}\right] \quad \checkmark \\
 \text{from eq (A)} \quad 0 &= \frac{AkR}{2} + \frac{B}{kR} = \frac{2W}{(1-k^2)} \frac{kR}{2} + \left[-\frac{Wk^2R^2}{2(1-k^2)}\right] \\
 &= \frac{WkR}{1-k^2} - \frac{Wk^2R^2}{1-k^2} \\
 \theta &= \frac{A\gamma}{2} + \frac{B}{\gamma} = \frac{2W\gamma}{2(1-k^2)} + \frac{1}{\gamma} \left[-\frac{2Wk^2R^2}{(1-k^2)}\right] \\
 &= \frac{W\gamma}{(1-k^2)} - \frac{1}{\gamma} \frac{Wk^2R^2}{(1-k^2)} = W \left[ \frac{\gamma}{(1-k^2)} - \frac{k^2R^2}{\gamma(1-k^2)} \right] \\
 &= \frac{W}{(1-k^2)} \left[ \frac{\gamma}{\gamma} - \frac{k^2R^2}{\gamma} \right] \quad \checkmark
 \end{aligned}$$

Let us look into in the final solution which we have gotten on the same way on the same thing we have done, you see boundary condition was  $V_{\theta}$  is equal to 0 with  $V_{\theta}$  is equal to 0 at  $r$  is equal to  $kR$  right and  $V_{\theta}$  is  $\omega R$  at  $r$  is equal to  $R$  right  $V_{\theta}$  is  $\omega R$  at  $r$  is equal to  $R$ , this was our  $V_{\theta}$  is 0 at  $r$  is equal to  $kR$  and  $V_{\theta}$  is equal to  $\omega R$  at  $r$  is equal to  $R$ , right. So if we do that we got  $A$  is equal to  $C$  we got  $A$  is equal to here we got  $A$  is equal to  $2\omega$  by  $1 - k^2$  right and  $B$  you we got is equal to  $-\omega k^2 R^2$  by  $1 - k^2$ .

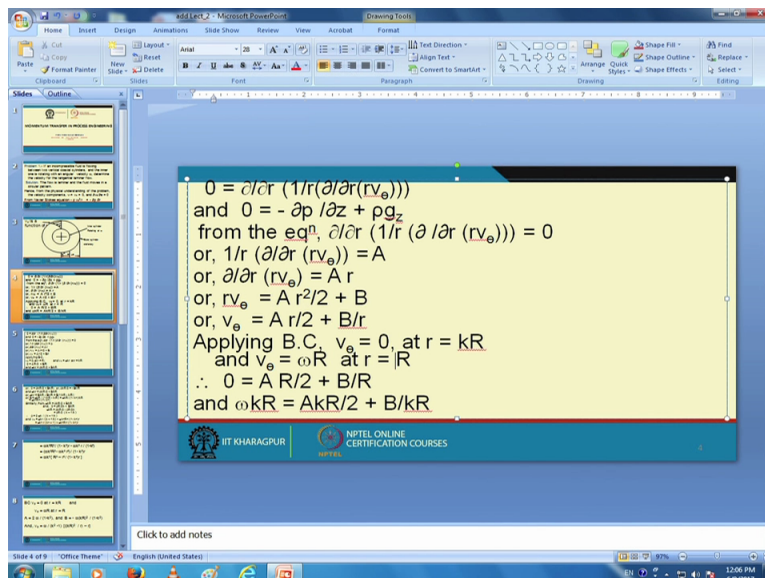

That is true and we got  $V_{\theta}$  is equal to ultimately this  $\omega$  divided by  $\omega$  okay  $\omega$  we can also write in this form this is equal to  $\omega$  by  $k^2 - 1$  if we take common from here then  $k^2 - 1$  so  $1 - k^2$  we have taken inside right, so that becomes equal to this into then first term is this one so  $k^2 R^2$  divided by this  $r$  remains there right and this  $r$  then goes there minus  $r$  so  $\omega$  by  $k^2 - 1$  into  $k^2 R^2$  whole square by  $r - r$ .

(Refer Slide Time: 24:18)

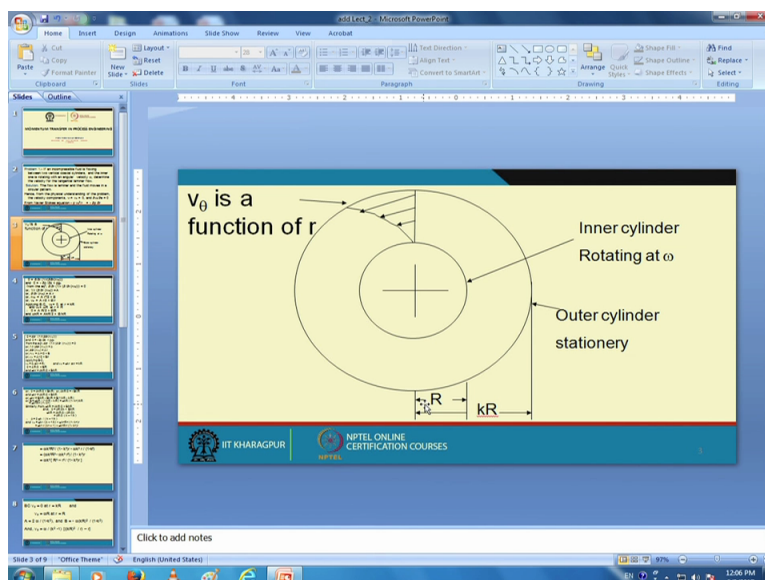

$0 = \frac{\partial}{\partial r} (1/r (\frac{\partial}{\partial r} (rv_\theta)))$   
 and  $0 = -\frac{\partial p}{\partial z} + \rho g_z$   
 from the eq<sup>n</sup>,  $\frac{\partial}{\partial r} (1/r (\frac{\partial}{\partial r} (rv_\theta))) = 0$   
 or,  $1/r (\frac{\partial}{\partial r} (rv_\theta)) = A$   
 or,  $\frac{\partial}{\partial r} (rv_\theta) = A r$   
 or,  $rv_\theta = A r^2/2 + B$   
 or,  $v_\theta = A r/2 + B/r$   
 Applying B.C,  
 $v_\theta = 0$ , at  $r = R$ ;      and  $v_\theta = \omega r$  at  $r = kR$   
 $0 = A R/2 + B/R$   
 and  $\omega kR = A kR/2 + B/kR$

$0 = \frac{\partial}{\partial r} (1/r (\frac{\partial}{\partial r} (rv_\theta)))$   
 and  $0 = -\frac{\partial p}{\partial z} + \rho g_z$   
 from the eq<sup>n</sup>,  $\frac{\partial}{\partial r} (1/r (\frac{\partial}{\partial r} (rv_\theta))) = 0$   
 or,  $1/r (\frac{\partial}{\partial r} (rv_\theta)) = A$   
 or,  $\frac{\partial}{\partial r} (rv_\theta) = A r$   
 or,  $rv_\theta = A r^2/2 + B$   
 or,  $v_\theta = A r/2 + B/r$   
 Applying B.C,  $v_\theta = 0$ , at  $r = kR$   
 and  $v_\theta = \omega R$  at  $r = R$   
 $\therefore 0 = A R/2 + B/R$   
 and  $\omega kR = A kR/2 + B/kR$

$v_\theta$  is a function of  $r$

Inner cylinder Rotating at  $\omega$   
 Outer cylinder stationary

This form and this form are same so we can say we have done the right thing. Only the thing which is required which you need to do here in between if you look at the solutions, the same solution original which we have started with, we have done up to this the same right, then we have changed the boundary, right so boundary was originally your  $V_{\theta}$  is 0 at  $r$  is equal to  $R$  and  $V_{\theta}$  is equal to  $kR$  at  $r$  is equal to  $kR$ . Here it is getting changed that  $V_{\theta}$  is zero at  $r$  is equal to  $kR$  and  $V_{\theta}$  is equal to  $\omega r$  at  $r$  is equal to capital  $R$  so this change we have to do and then as we have shown the solutions here, so in that way if you go and solve I hope you will get the same.

Please do the required changes please do the required changes in the in the in the in the slides okay. Let us also since we can do it let us look into this and do that boundary condition was  $V_{\theta}$  was equal to 0 at  $r$  is equal to  $kR$  at  $r$  is equal to  $kR$  and we can write  $V_{\theta}$  is equal to  $\omega R$  at  $r$  is equal to  $R$  right, in our new system here as we have seen this is  $\omega R$  and  $kR$ , right so at  $r$  is equal to  $R$  this  $V_{\theta}$  is equal to this is fixed.

So at  $r$  is equal to  $R$  this is  $V_{\theta}$  is  $\omega R$  and at  $r$  is equal to  $kR$   $V_{\theta}$  is 0 at  $r$  is equal to  $kR$   $V_{\theta}$  is equal to 0 and this now if we substitute them, then we can write that in the 1<sup>st</sup> one 0 is equal to here right 0 is equal to  $A$  into  $r$  by 2 plus  $B$  by  $r$ . This  $V_{\theta}$  goes to 0 at  $r$  is equal to  $kR$  then this should be 0 is equal to  $A$   $kR$  by 2 and this is  $b$  by  $kR$  right and in the second case  $\omega R$  is equal to  $AR$  by 2 and  $B$  by  $R$ , right so from there from there the same this of course repeat so hopefully we can delete this.

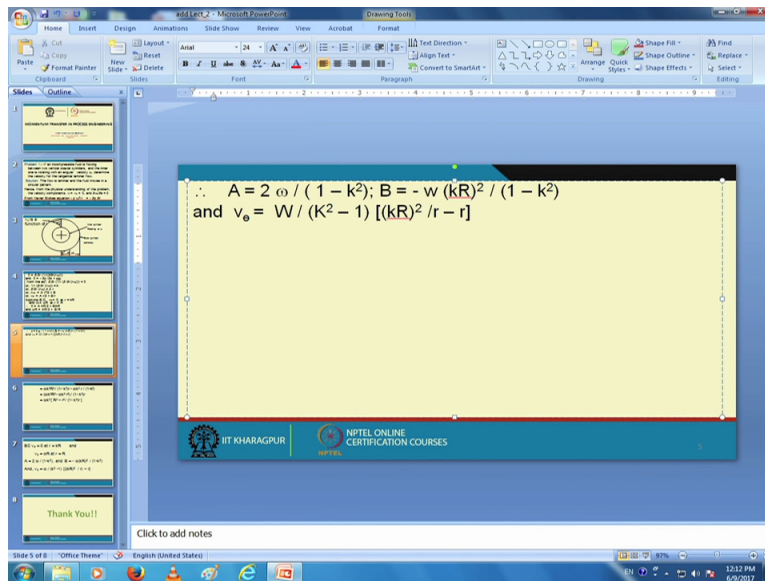

Okay so from there we on simplification we do not write on these because we have shown you there we can write simply that what is  $A$ , so  $A$  has come  $2\omega$  by  $1 - k^2$   $2\omega$  by  $1 - k^2$ . This is  $1 - k^2$ , right. So we put here a square  $1 - k^2$  right and  $B$  is equal to but it is also required and  $B$  is equal to we have we have a obtained here as you see that  $V_{\theta}$  was this minus  $\omega k^2$  minus  $\omega$  into  $k$  into  $R$  whole square that is much easier and better.

(Refer Slide Time: 26:29)

$0 = \frac{d}{dr} \left( \frac{1}{r} \frac{d}{dr} (r v_\theta) \right)$   
 and  $0 = -\frac{dp}{dz} + \rho g_z$   
 from the eqn,  $\frac{d}{dr} \left( \frac{1}{r} \frac{d}{dr} (r v_\theta) \right) = 0$   
 or,  $\frac{1}{r} \frac{d}{dr} (r v_\theta) = A$   
 or,  $\frac{d}{dr} (r v_\theta) = A r$   
 or,  $r v_\theta = A r^2/2 + B$   
 or,  $v_\theta = A r/2 + B/r$   
 Applying B.C,  $v_\theta = 0$ , at  $r = kR$   
 and  $v_\theta = \omega R$  at  $r = R$   
 $\therefore 0 = A R/2 + B/R$   
 and  $\omega kR = A kR/2 + B/kR$

$0 = \frac{d}{dr} \left( \frac{1}{r} \frac{d}{dr} (r v_\theta) \right)$   
 and  $0 = -\frac{dp}{dz} + \rho g_z$   
 from the eqn,  $\frac{d}{dr} \left( \frac{1}{r} \frac{d}{dr} (r v_\theta) \right) = 0$   
 or,  $\frac{1}{r} \frac{d}{dr} (r v_\theta) = A$   
 or,  $\frac{d}{dr} (r v_\theta) = A r$   
 or,  $r v_\theta = A r^2/2 + B$   
 or,  $v_\theta = A r/2 + B/r$   
 Applying B.C,  
 $v_\theta = 0$ , at  $r = R$ ; and  $v_\theta = \omega kR$  at  $r = kR$   
 $0 = A R/2 + B/R$   
 and  $\omega kR = A kR/2 + B/kR$

$\therefore A = \frac{2 \omega k}{k - 1/k}$   
 and  $v_\theta = \frac{\omega k r}{k - 1/k} + \frac{\omega k^2 R^2}{1 - k^2} r$   
 $= \frac{\omega k^2 r}{k^2 - 1} + \frac{\omega k^2 R^2}{1 - k^2} r$

K into omega square right and this divided by divided by it was 1 minus k square, right 1 minus k square right, so that k square is this 1 minus k square yeah. So if that be true and then the final equation which we got for V theta was this V theta was omega by k square minus 1 omega by K square minus 1 K square minus 1 right times if it take this times kR square by r, kR square square by r minus r, right.

So this was our solution, so we got it so we have corrected also, so as we as we as we requested you in the previous class in the previous problem that we have done on the paper but corresponding slides were not properly corrected and we requested you that if you go it to that slide get that thing connected and because we have done on the paper. Here we have done both on the paper as well as on the slides, so this is the final V theta expression that V theta is equal omega by K square minus 1 into kR square by 2 by R square by r minus r. So hopefully we have seen it and that is the final. Thank you.
